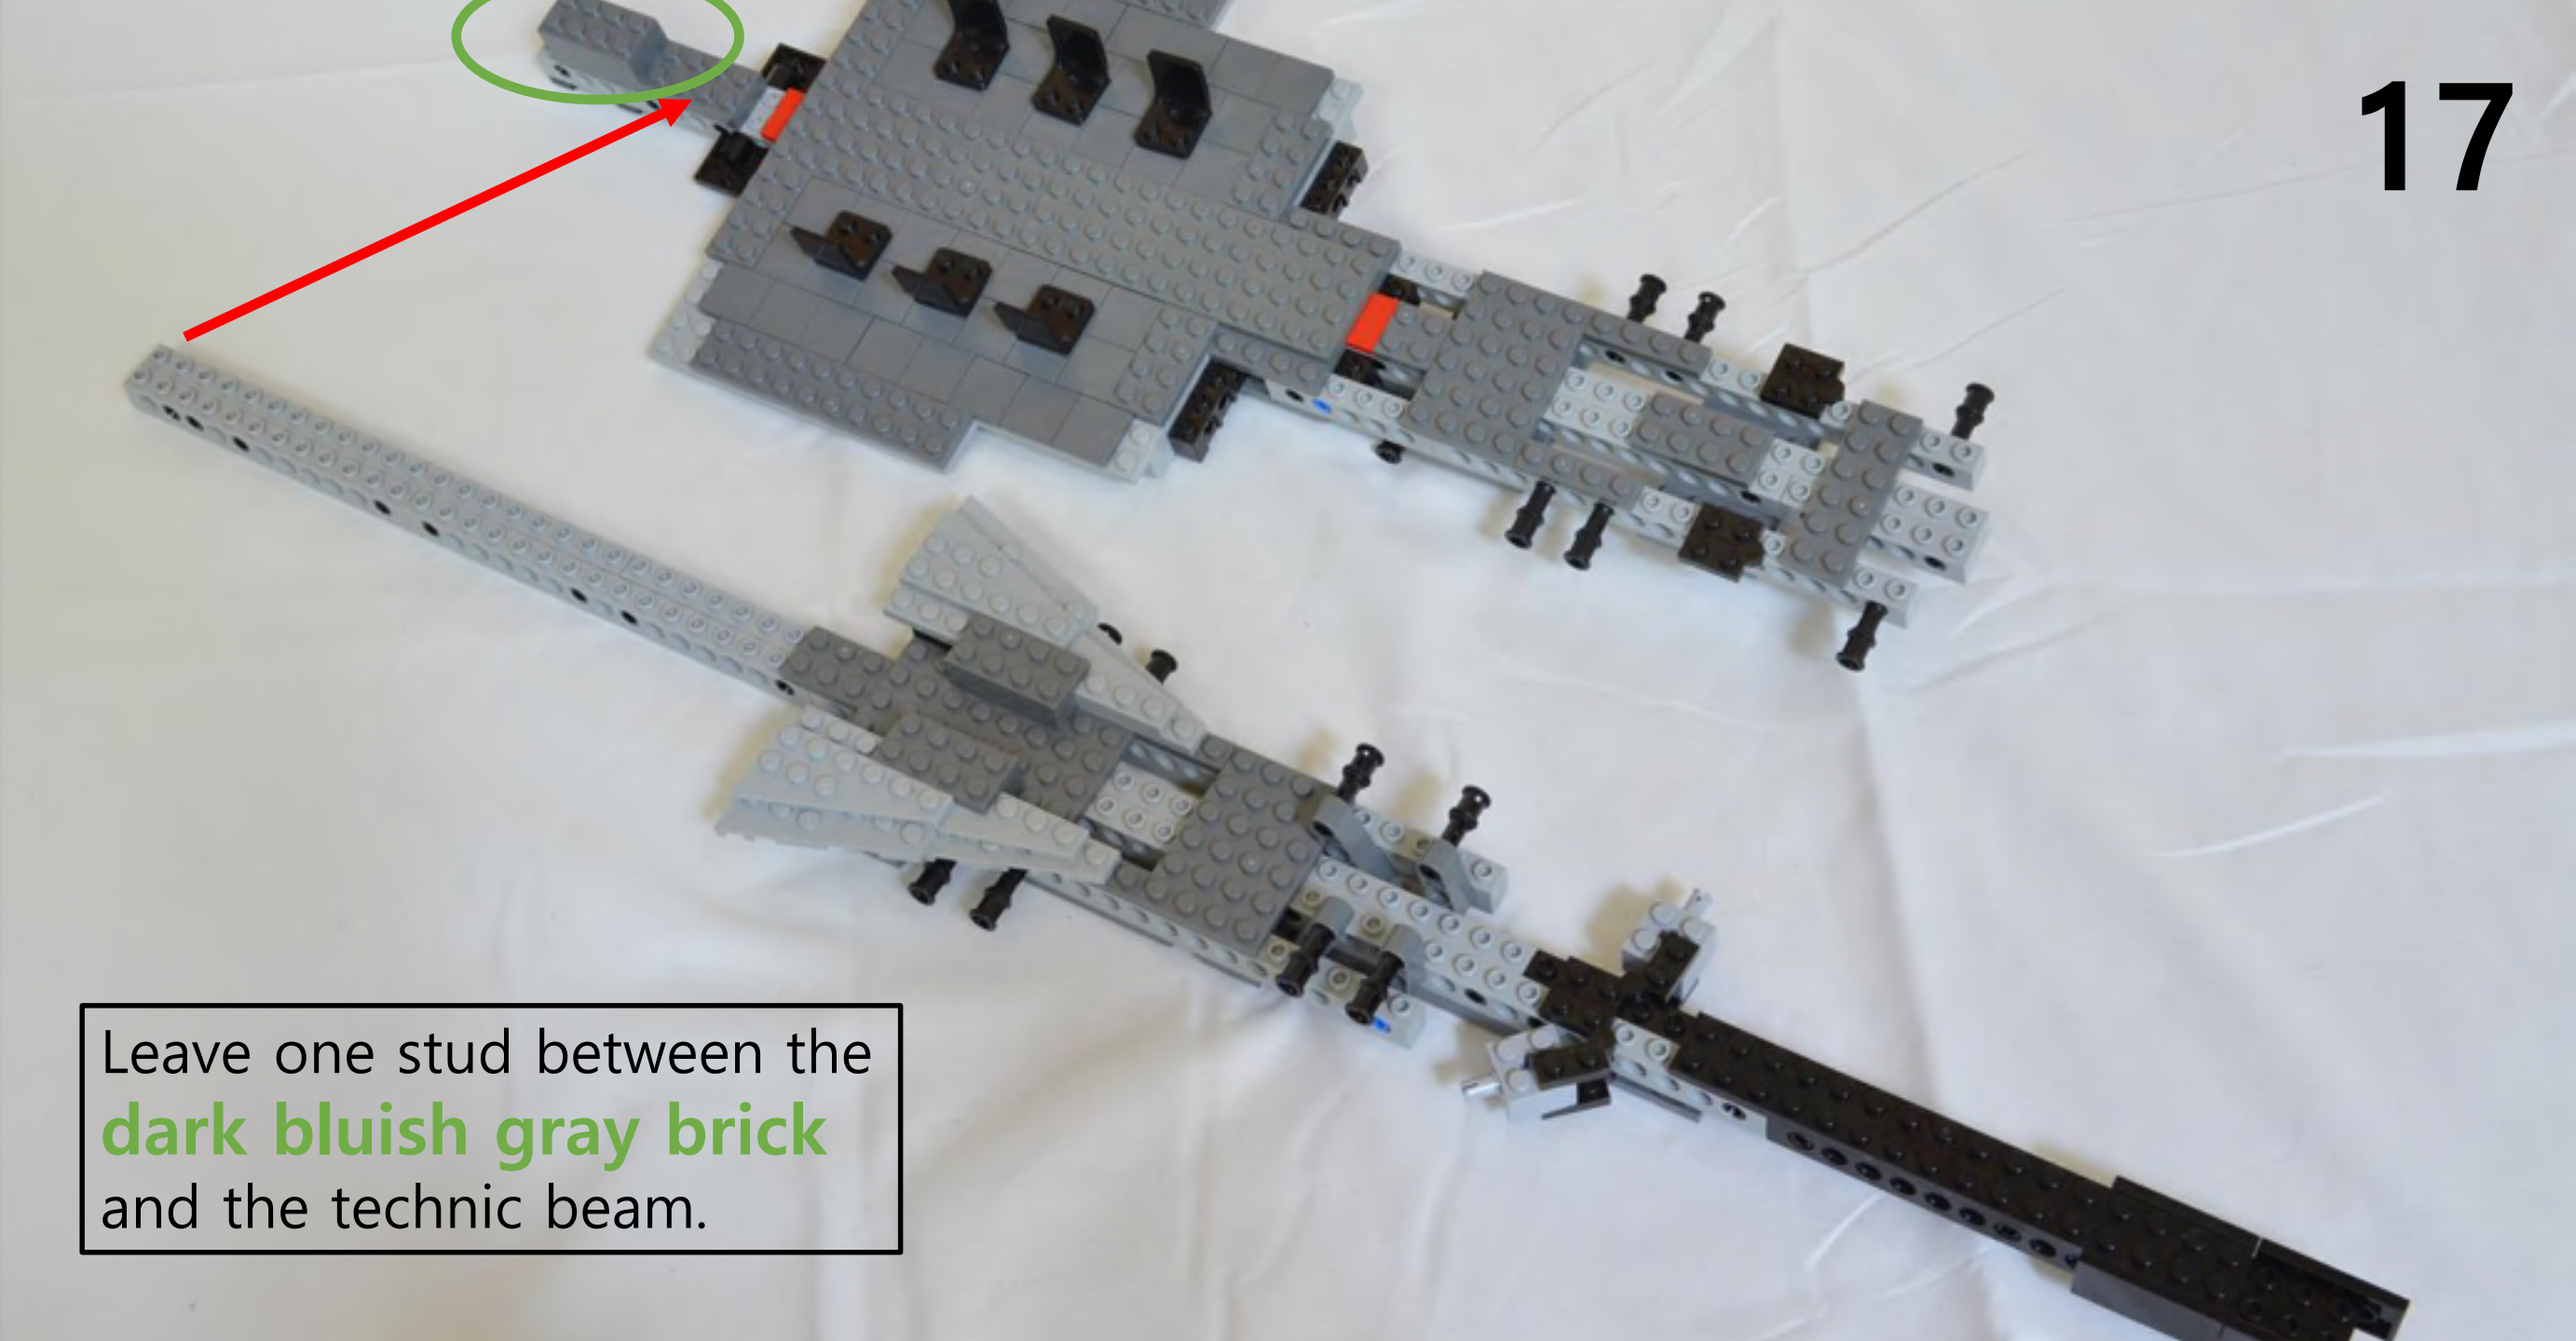
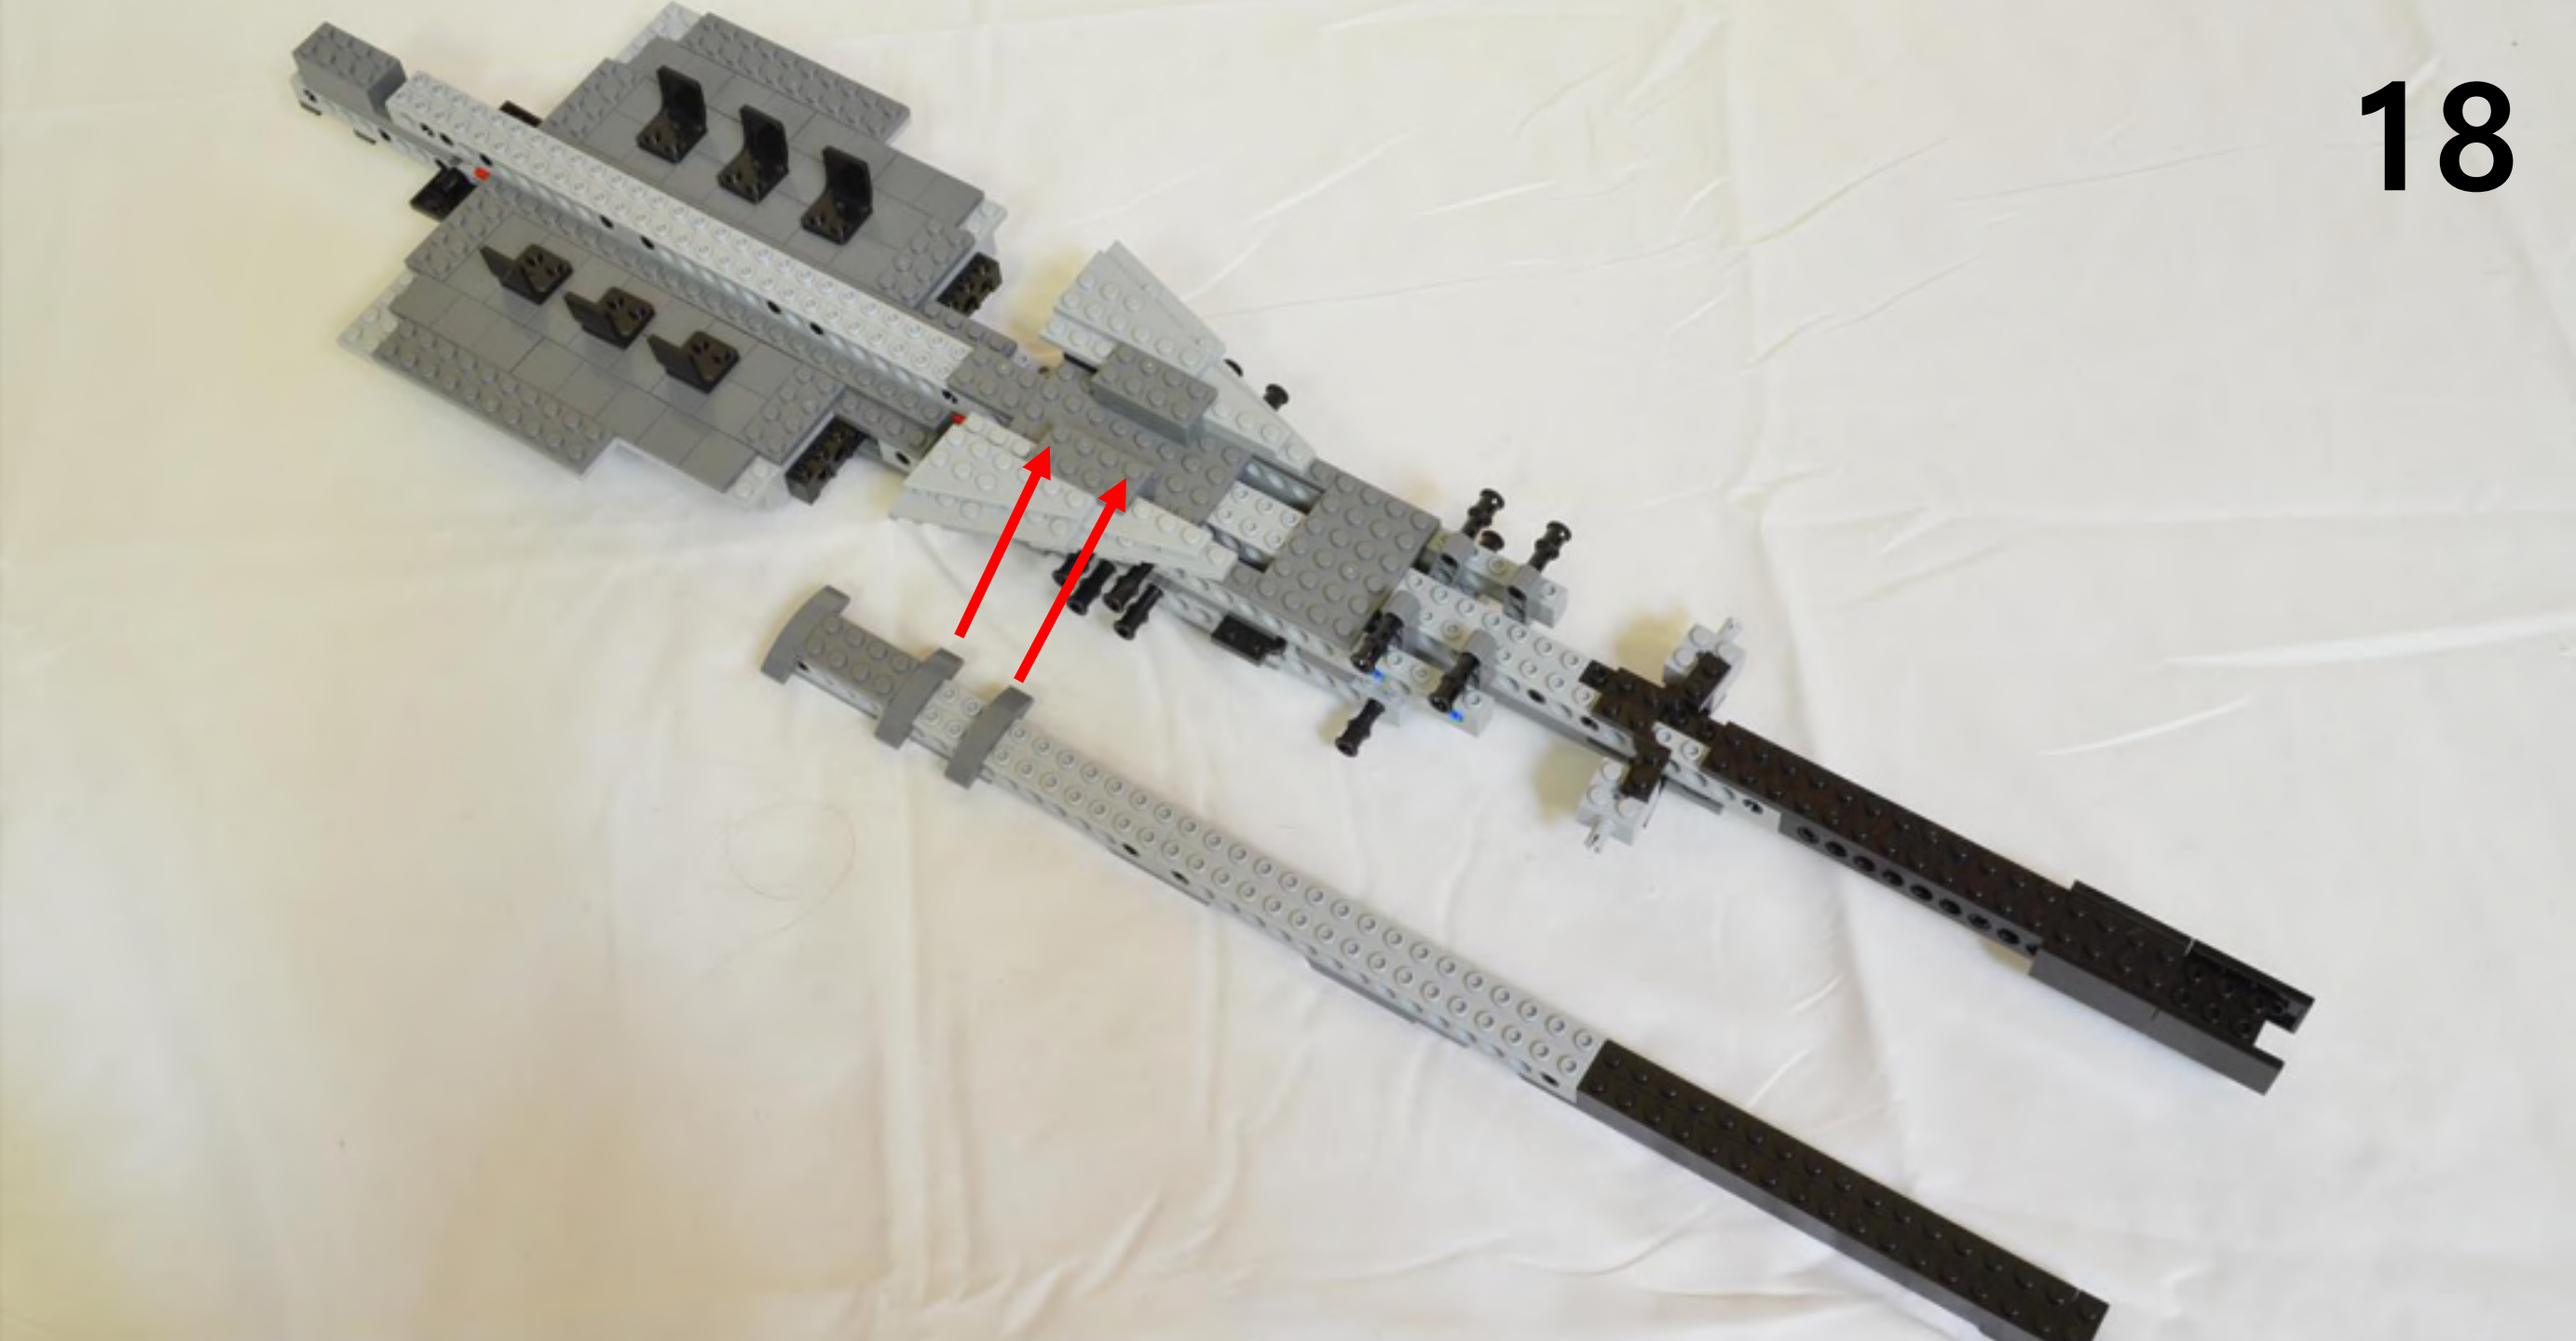
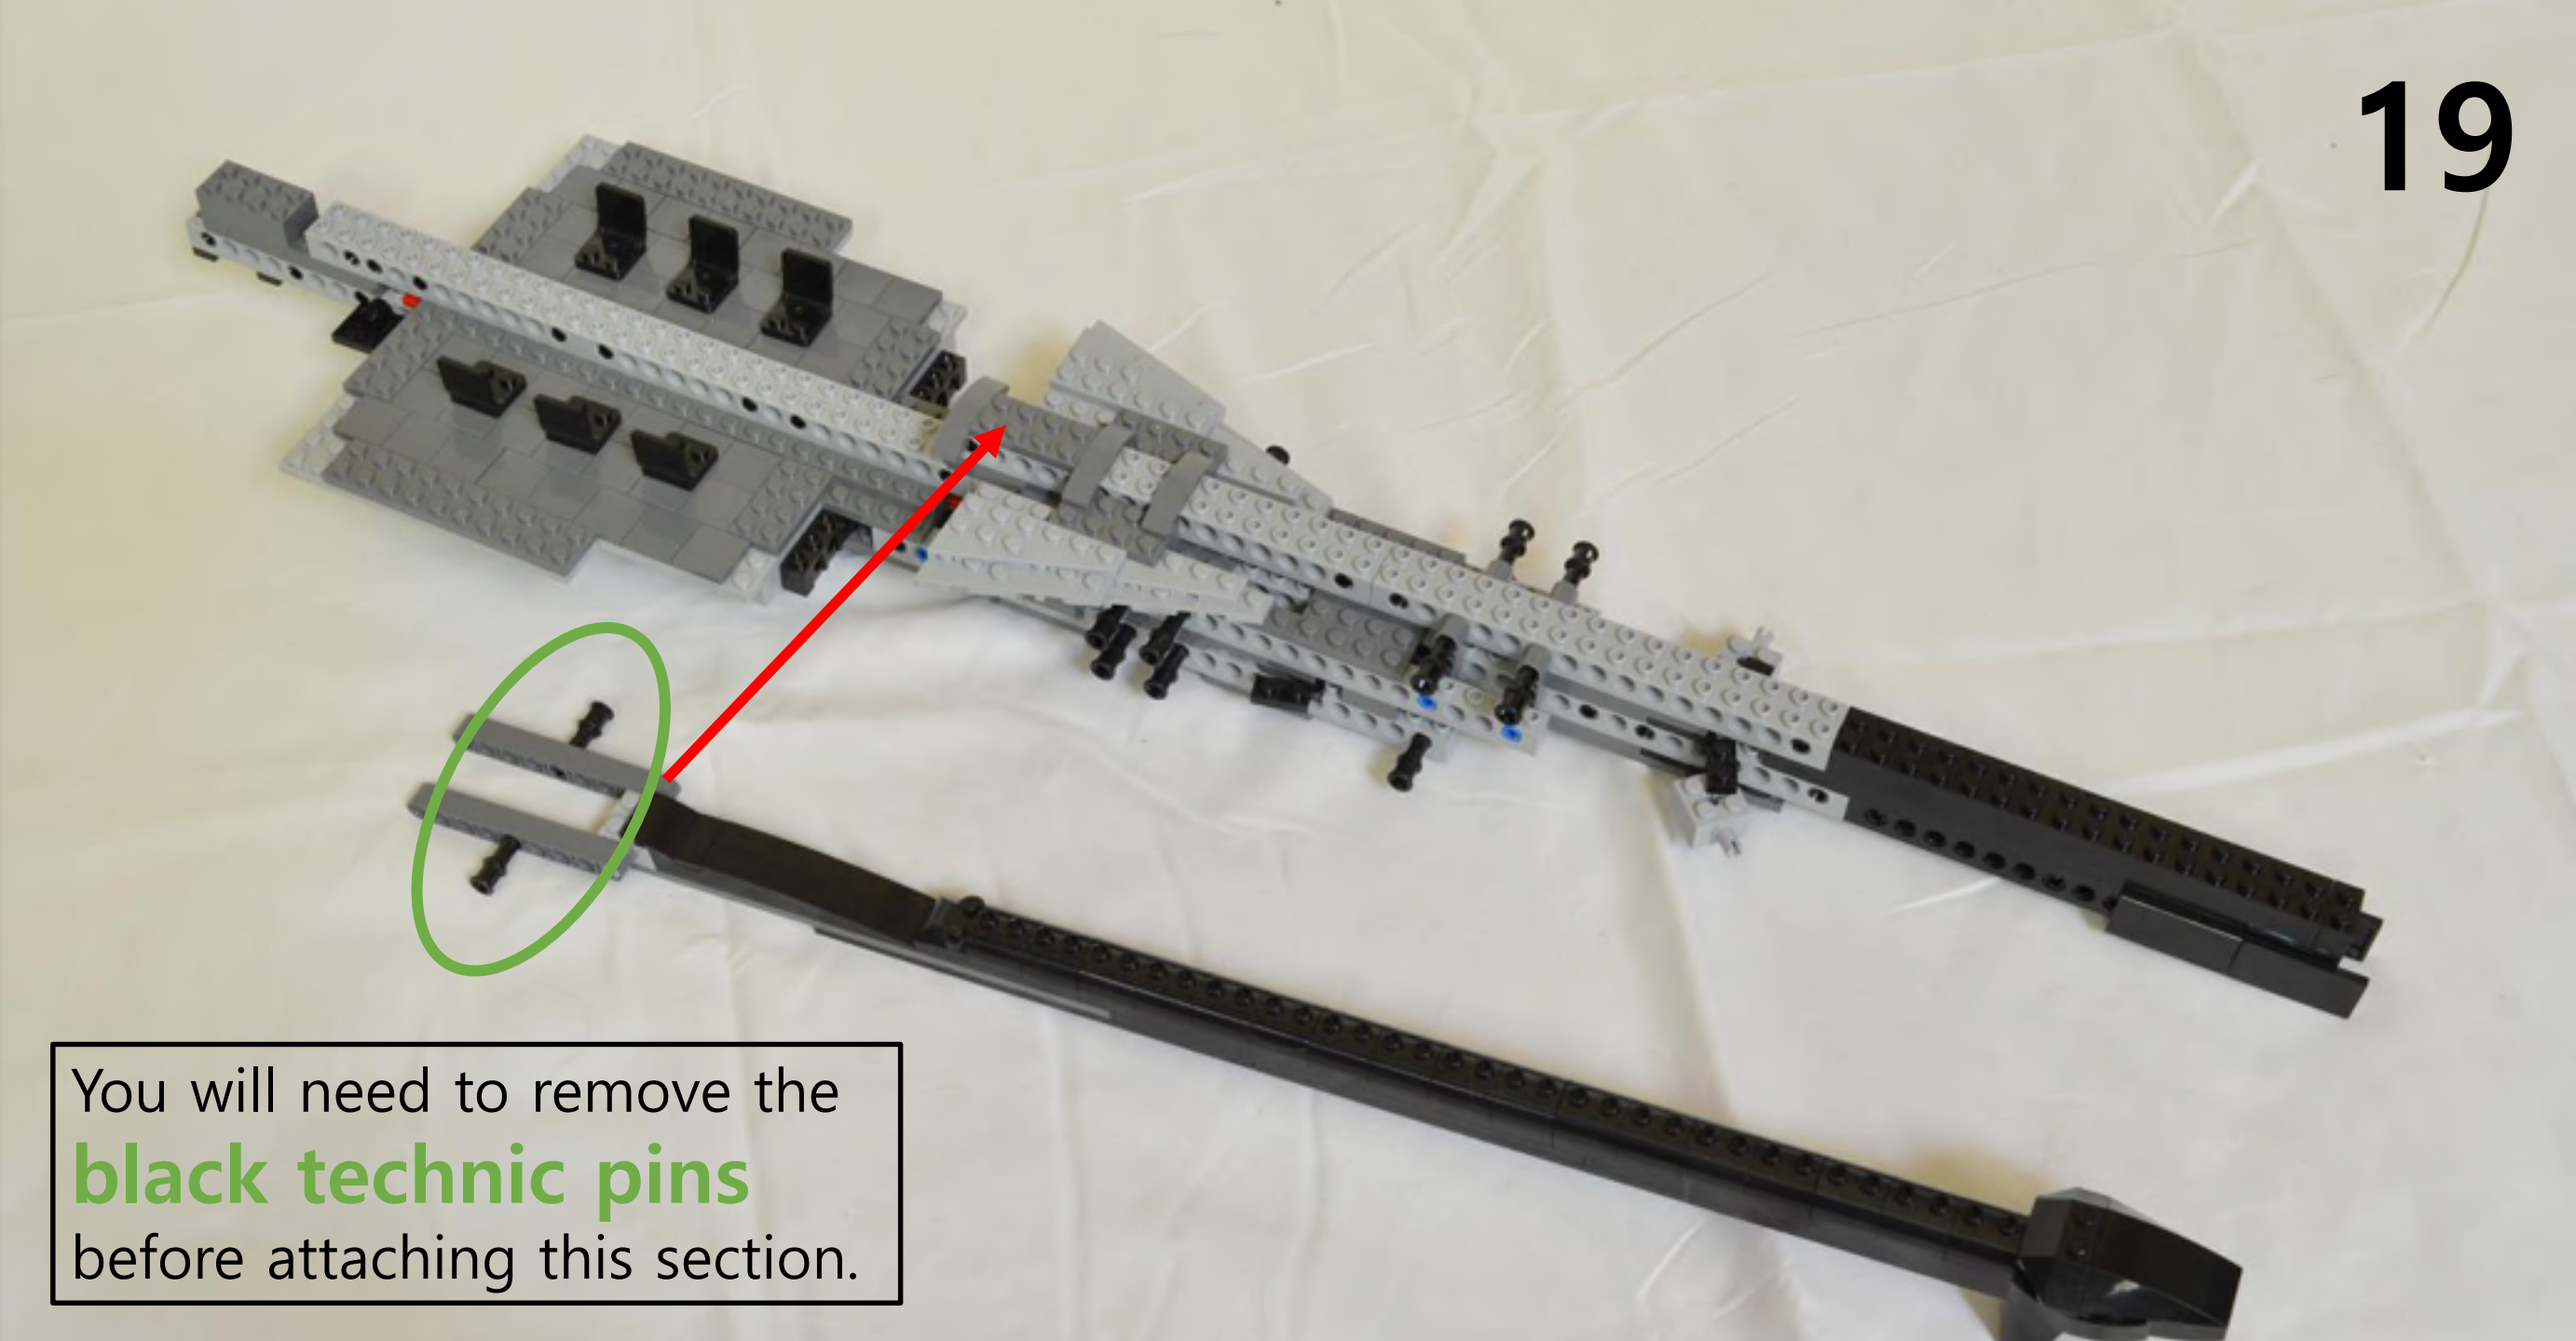
The panel will sit between the two red tiles.

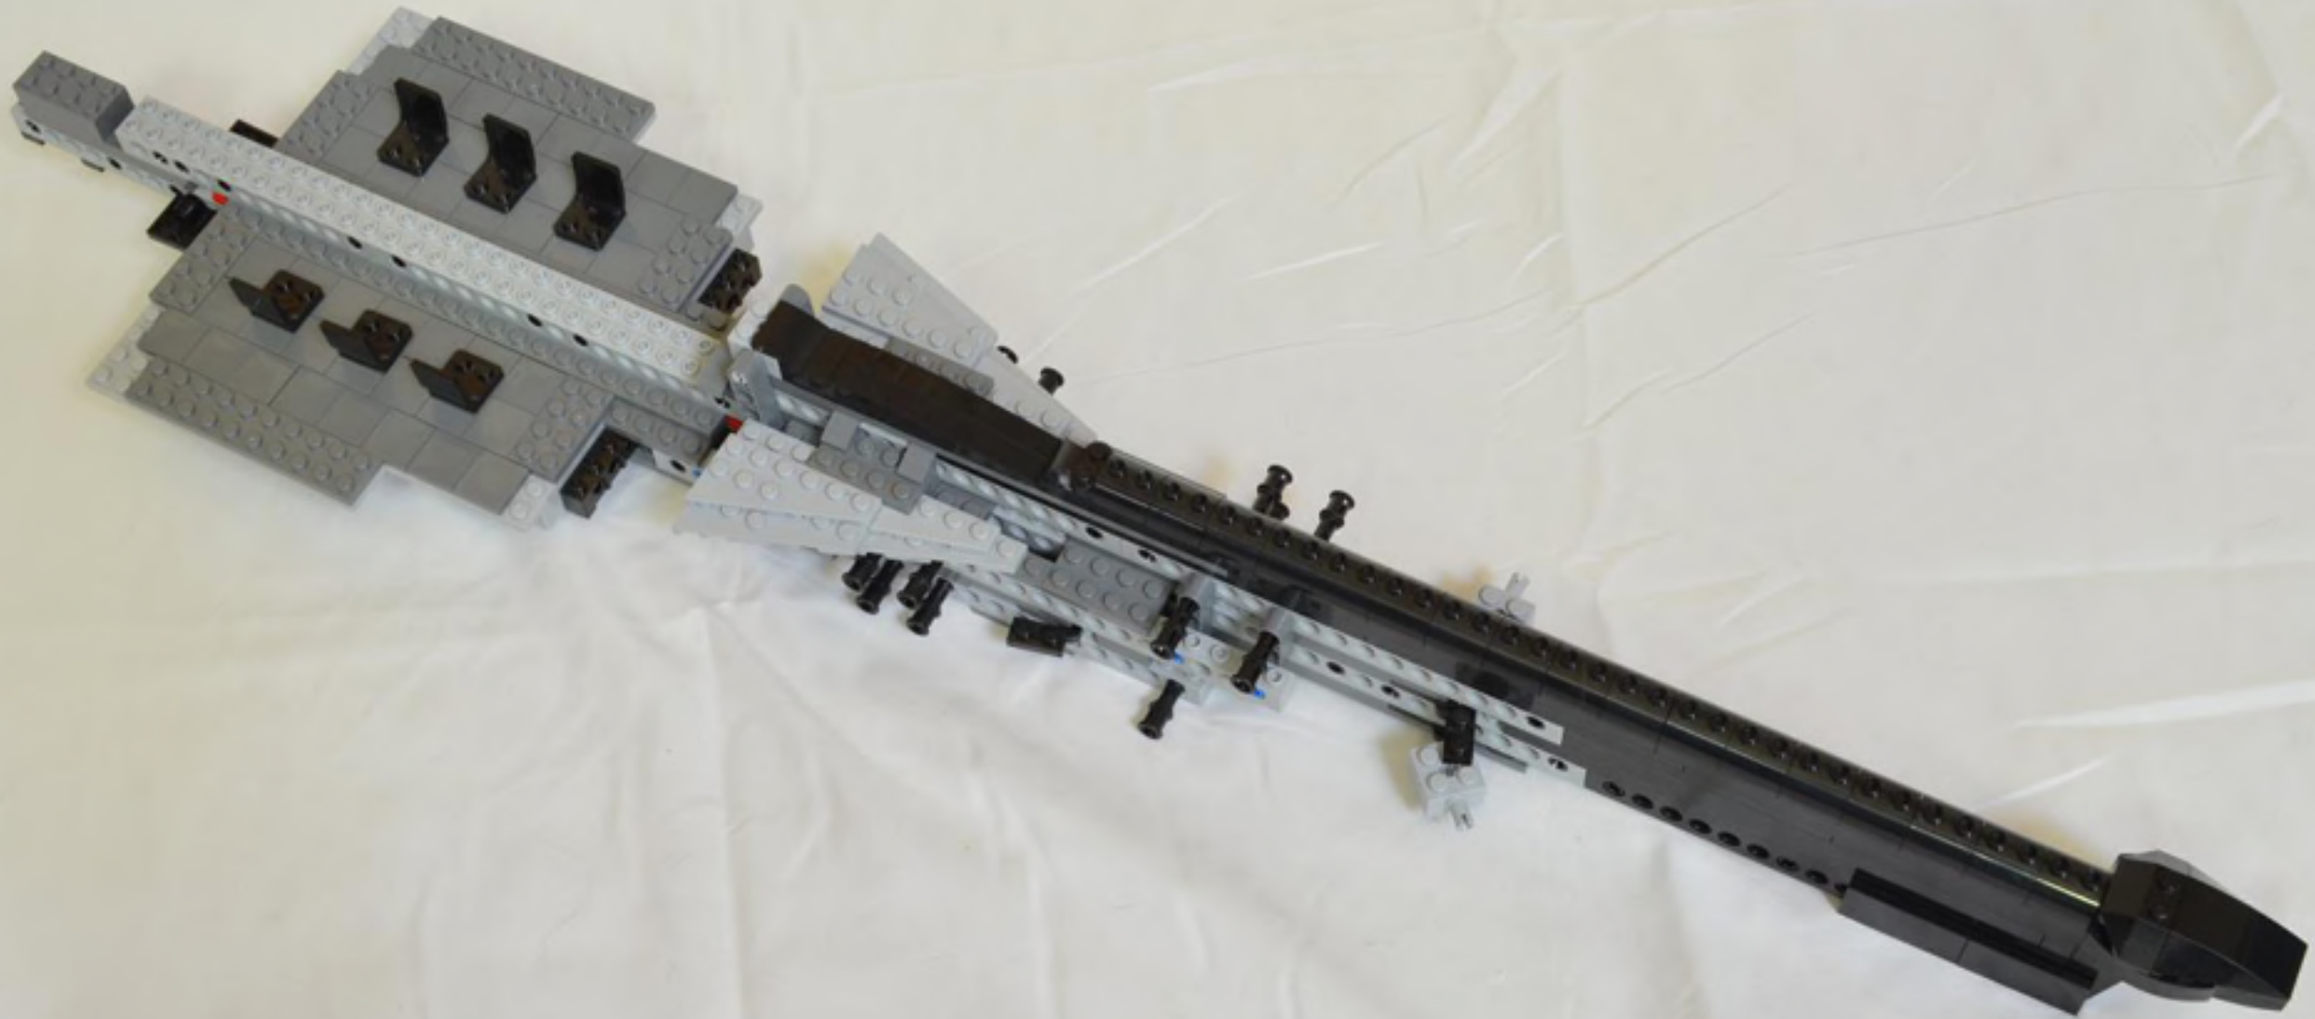


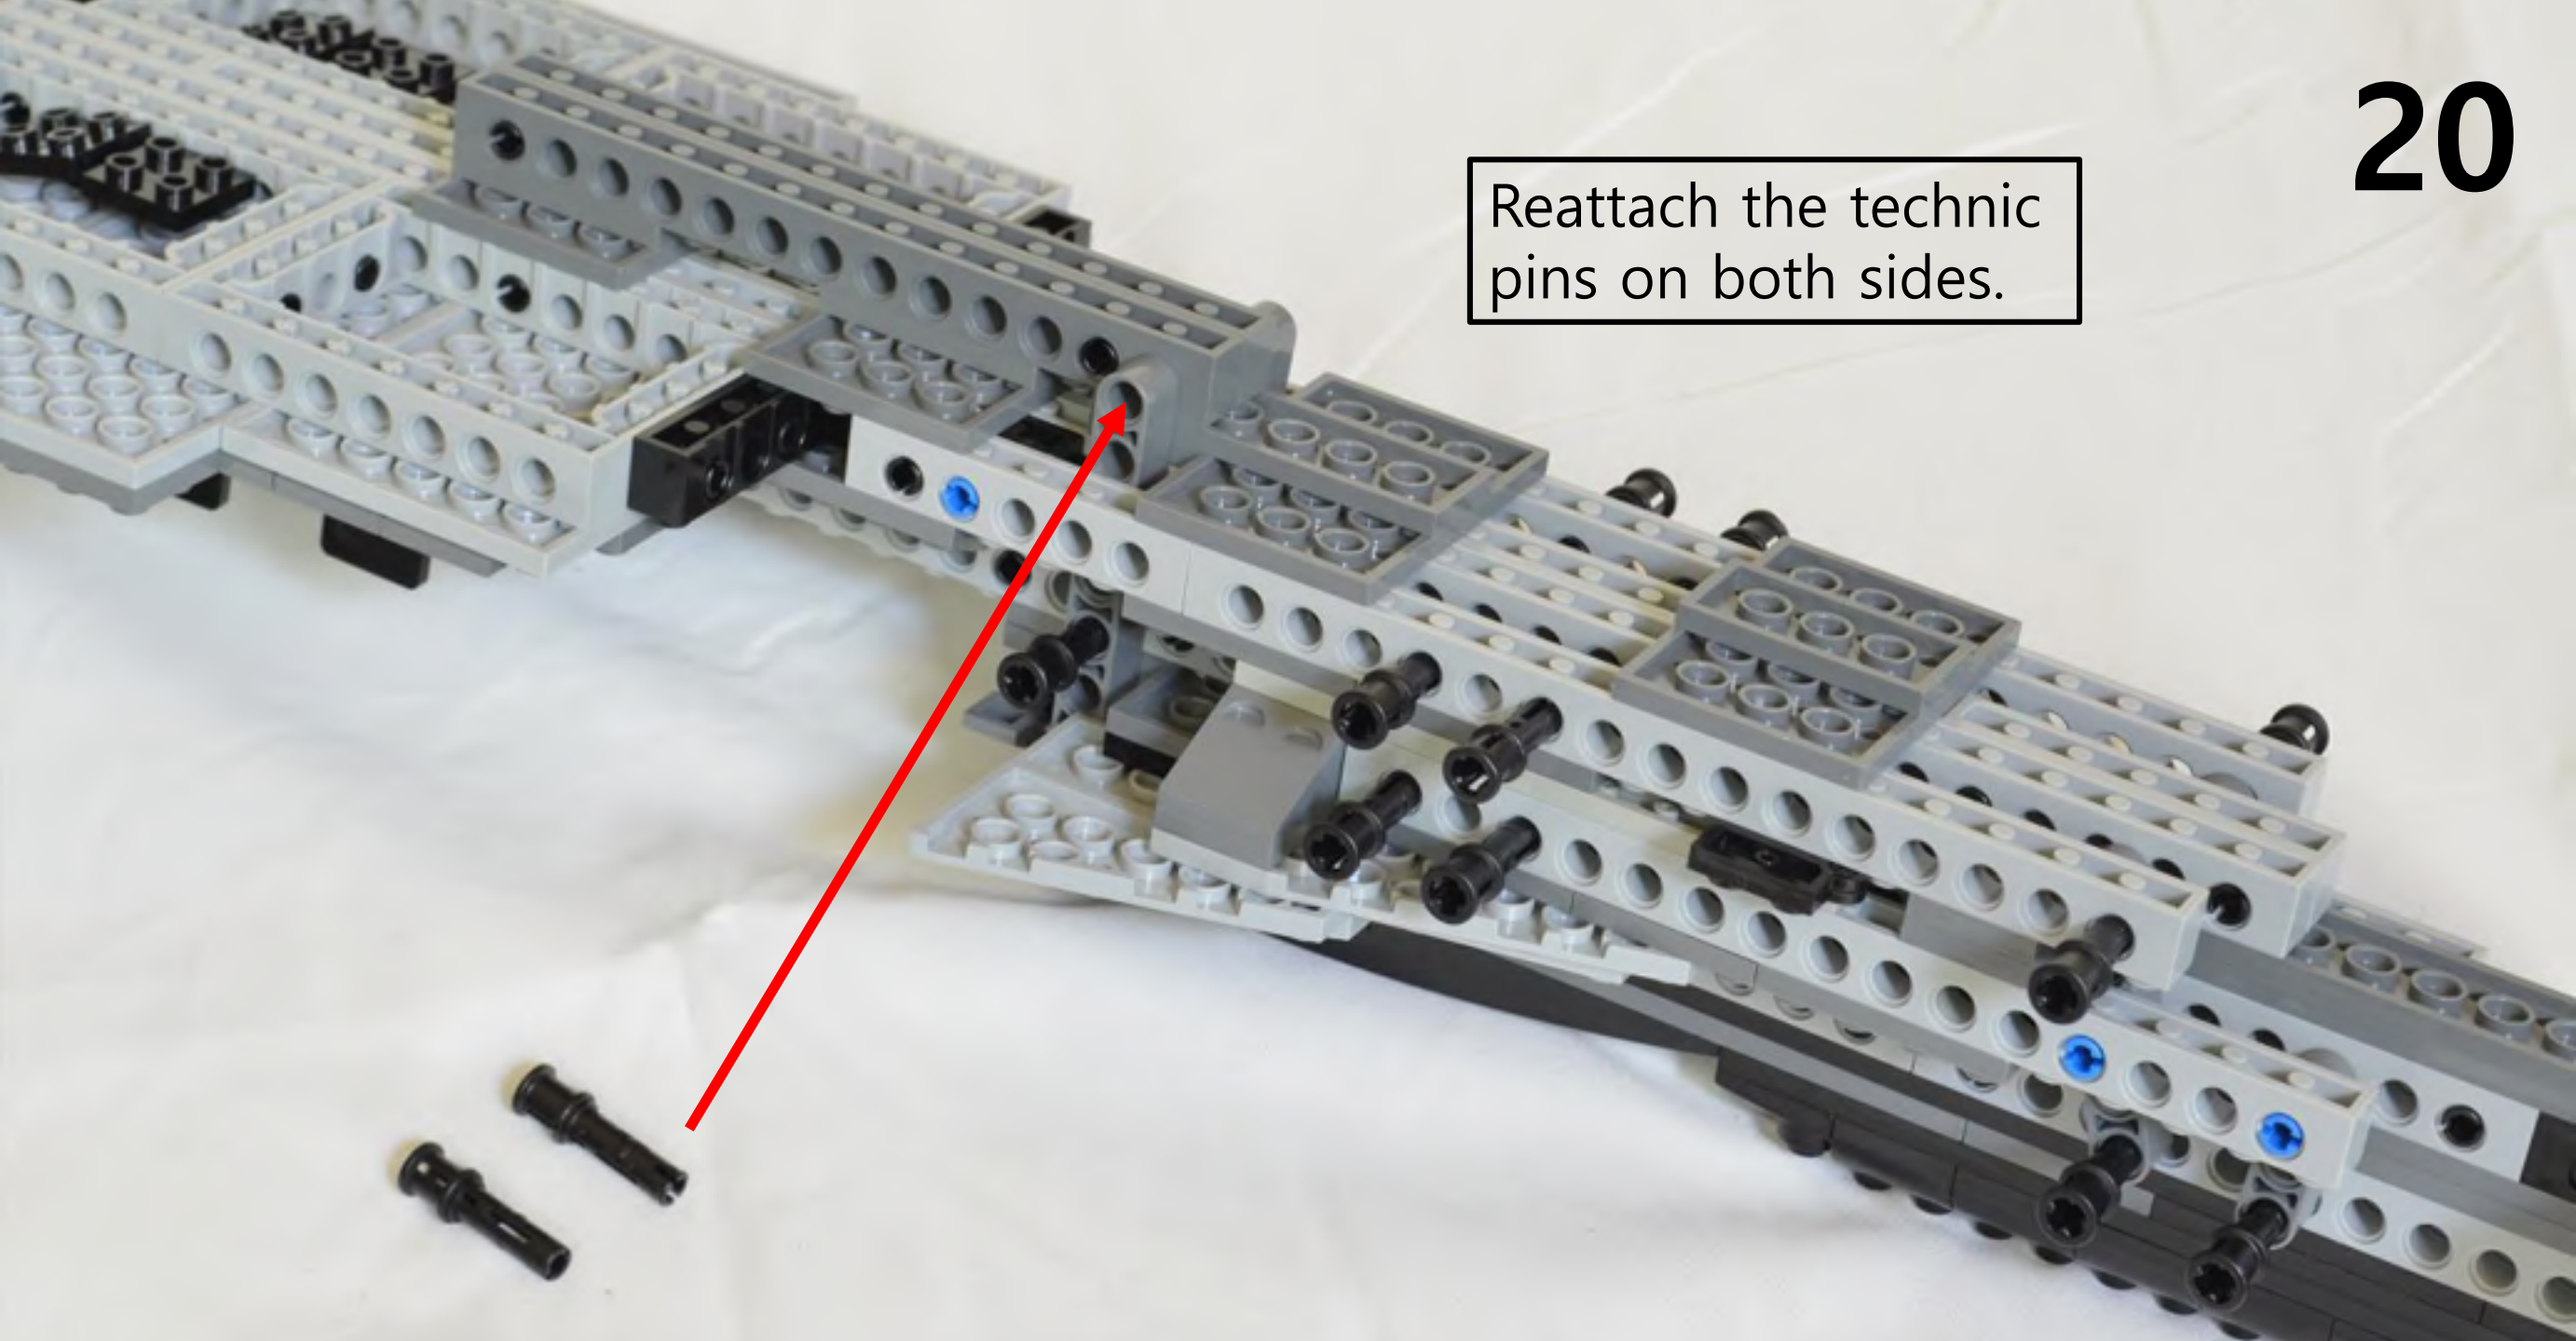
Leave one stud between the **dark bluish gray brick** and the technic beam.



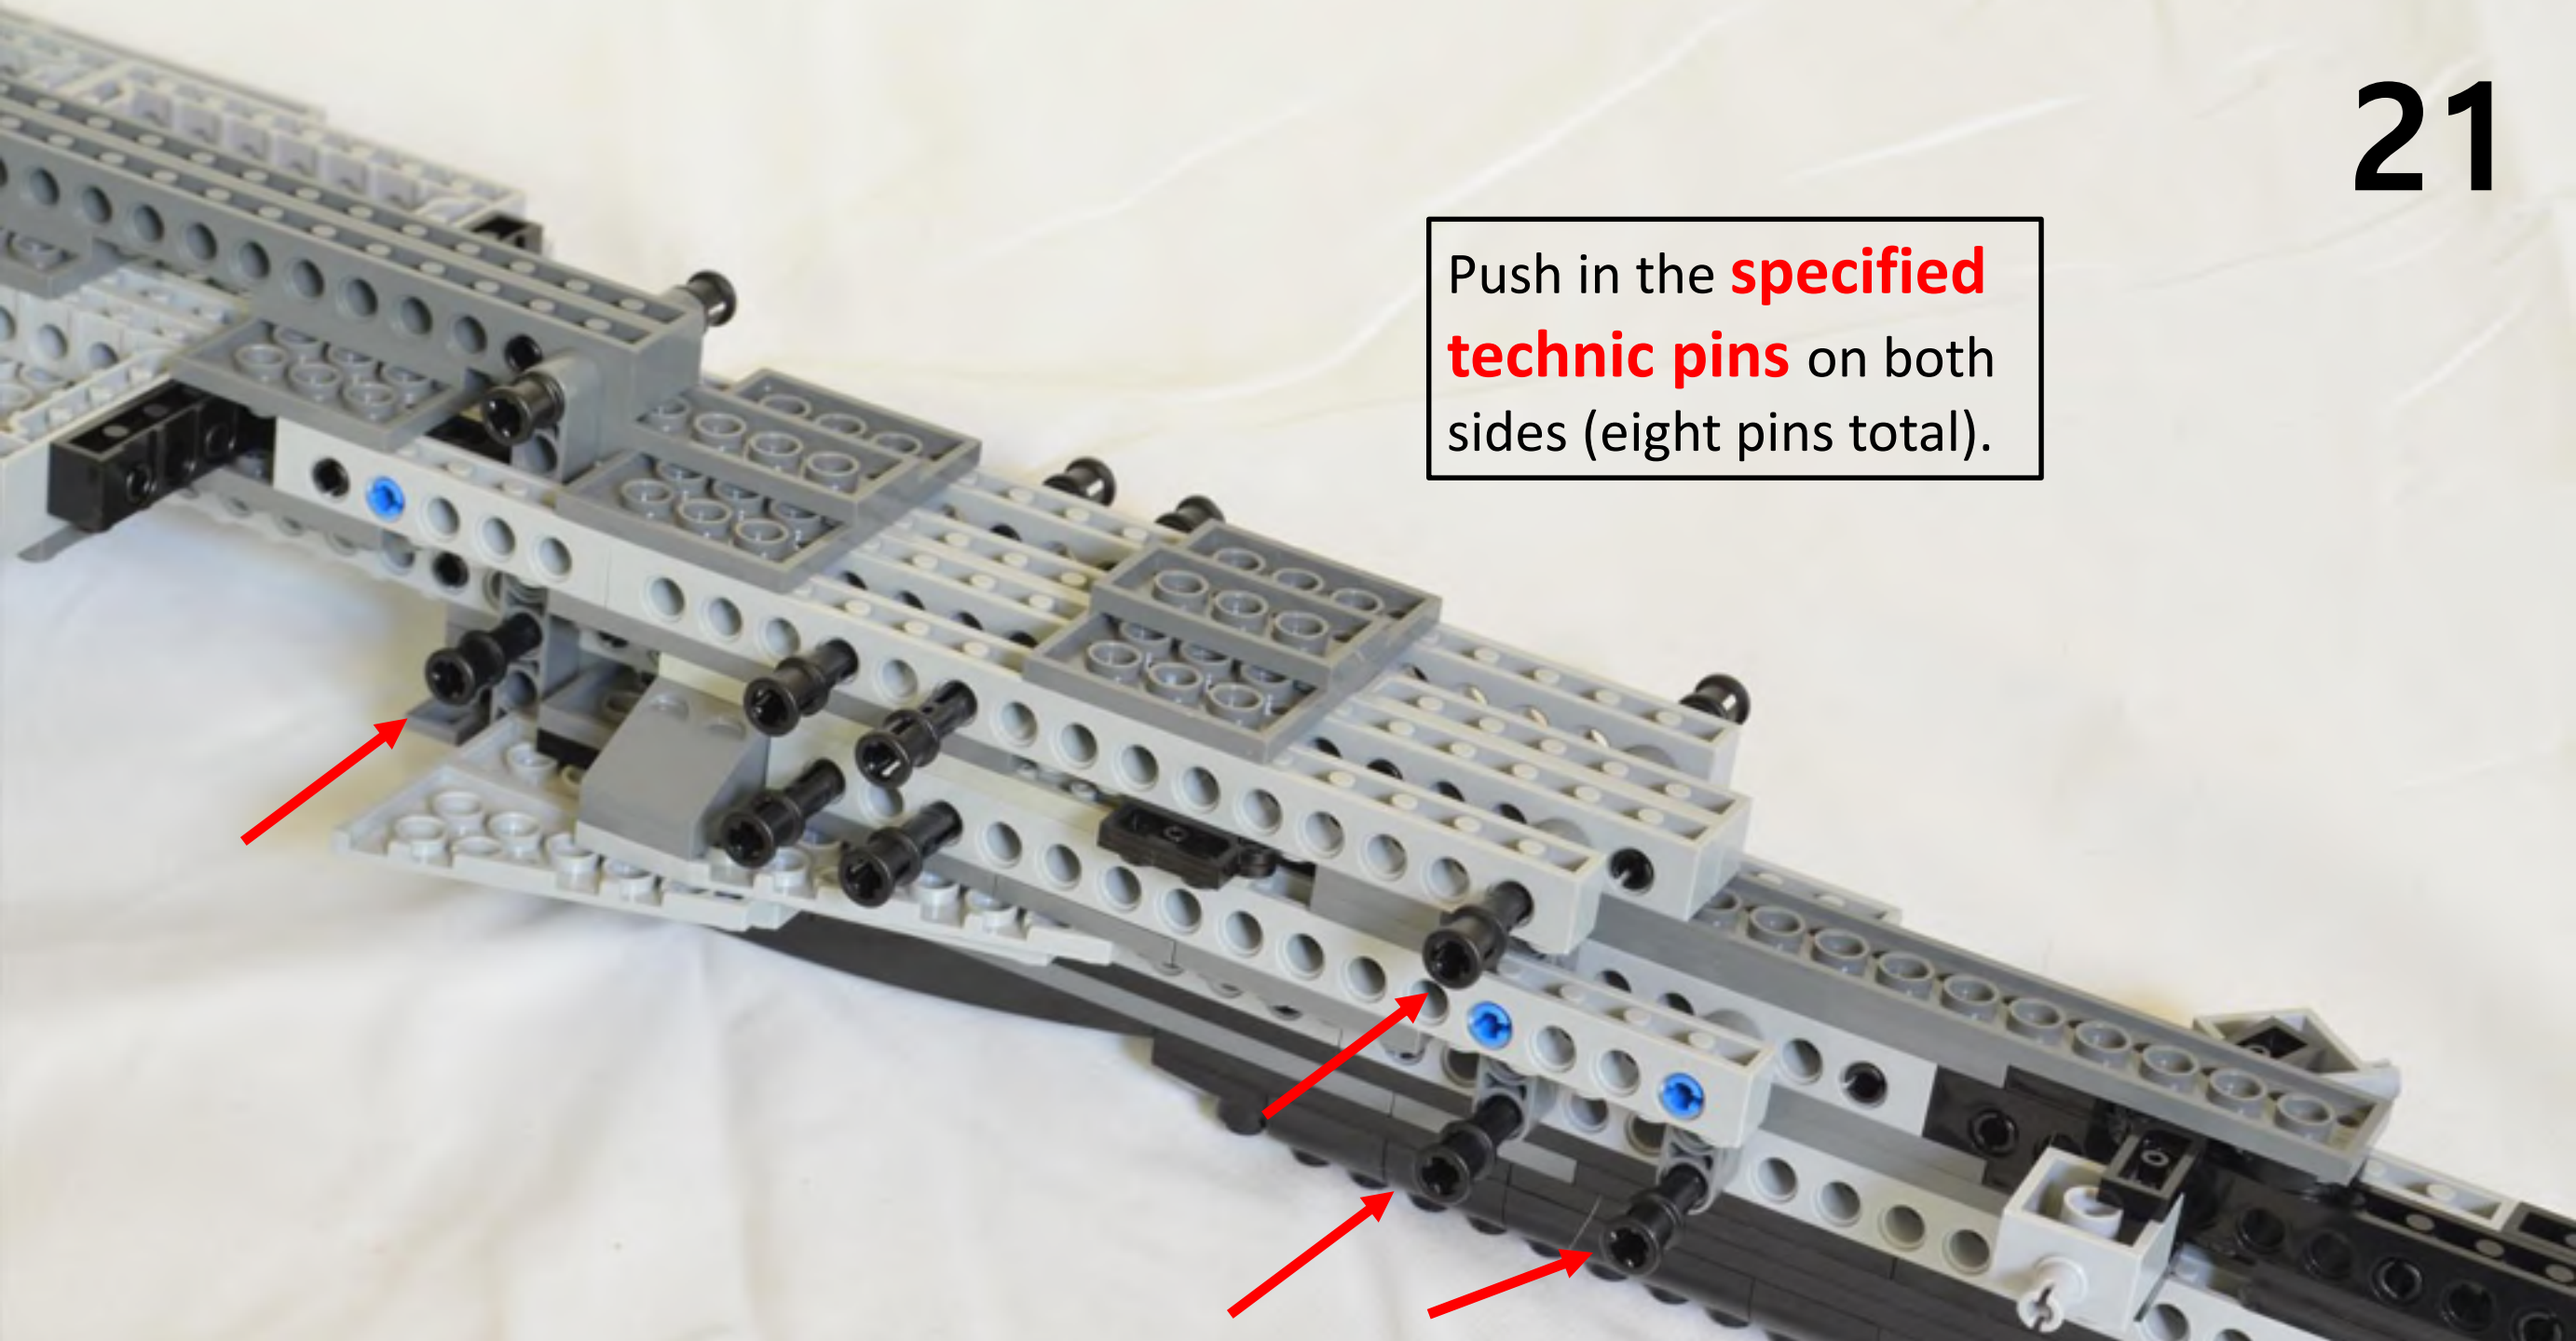


You will need to remove the **black technic pins** before attaching this section.

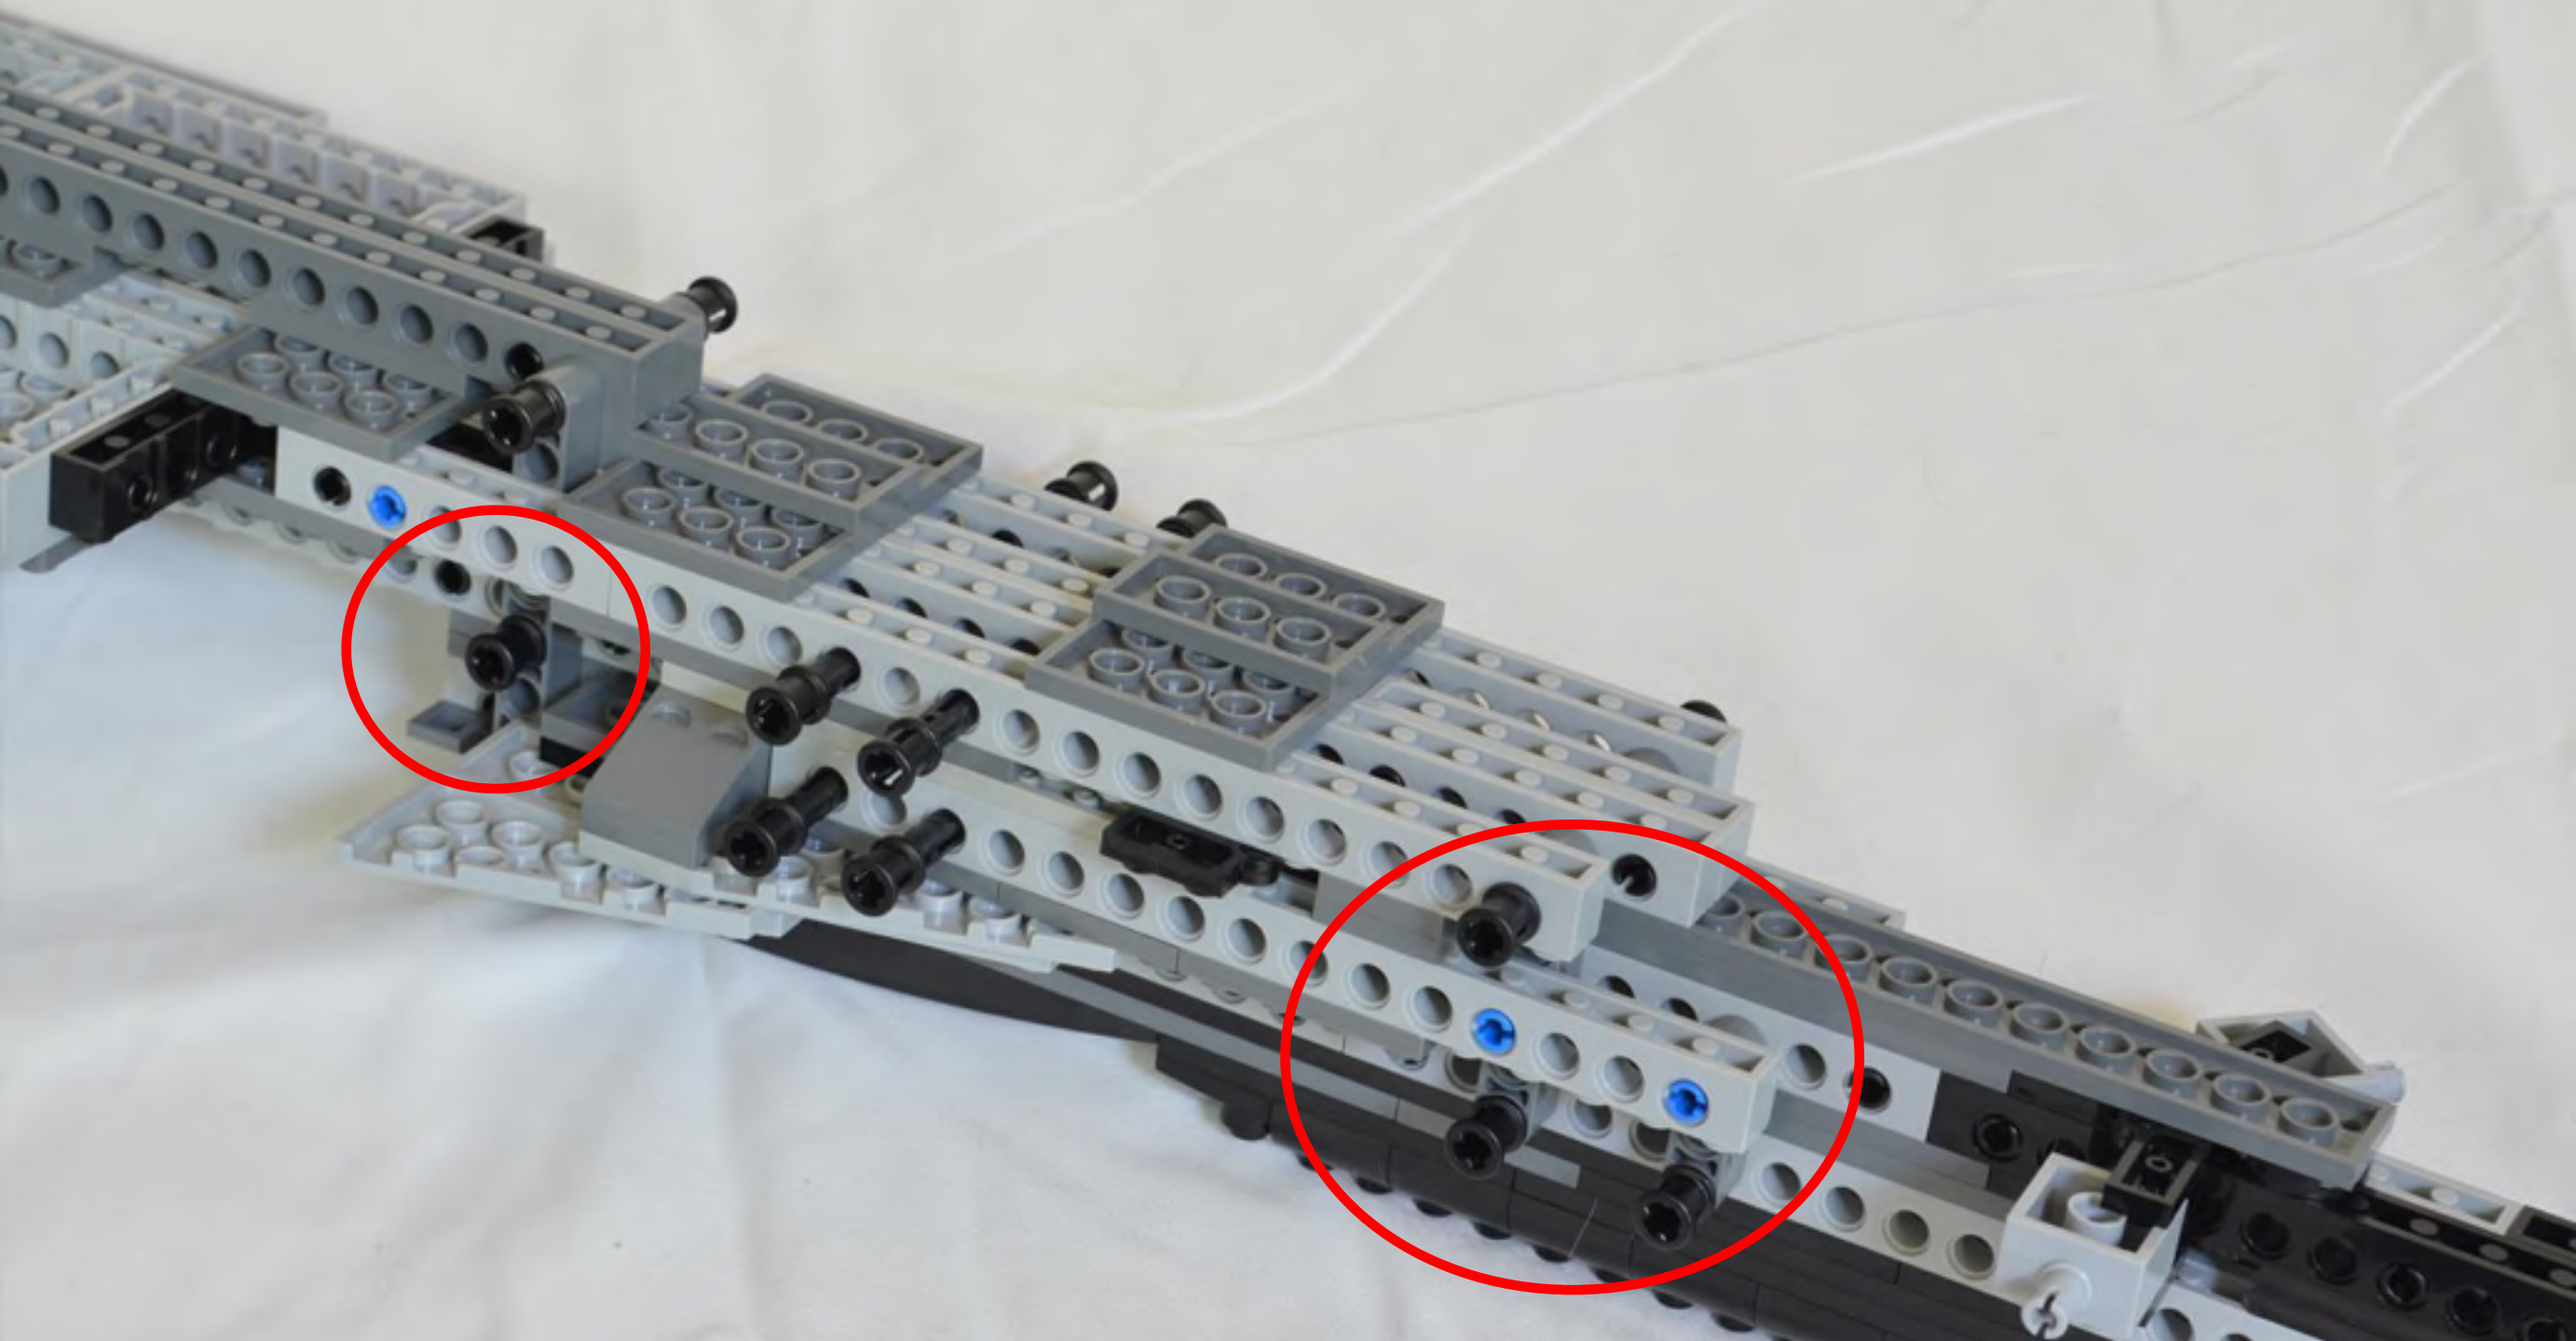


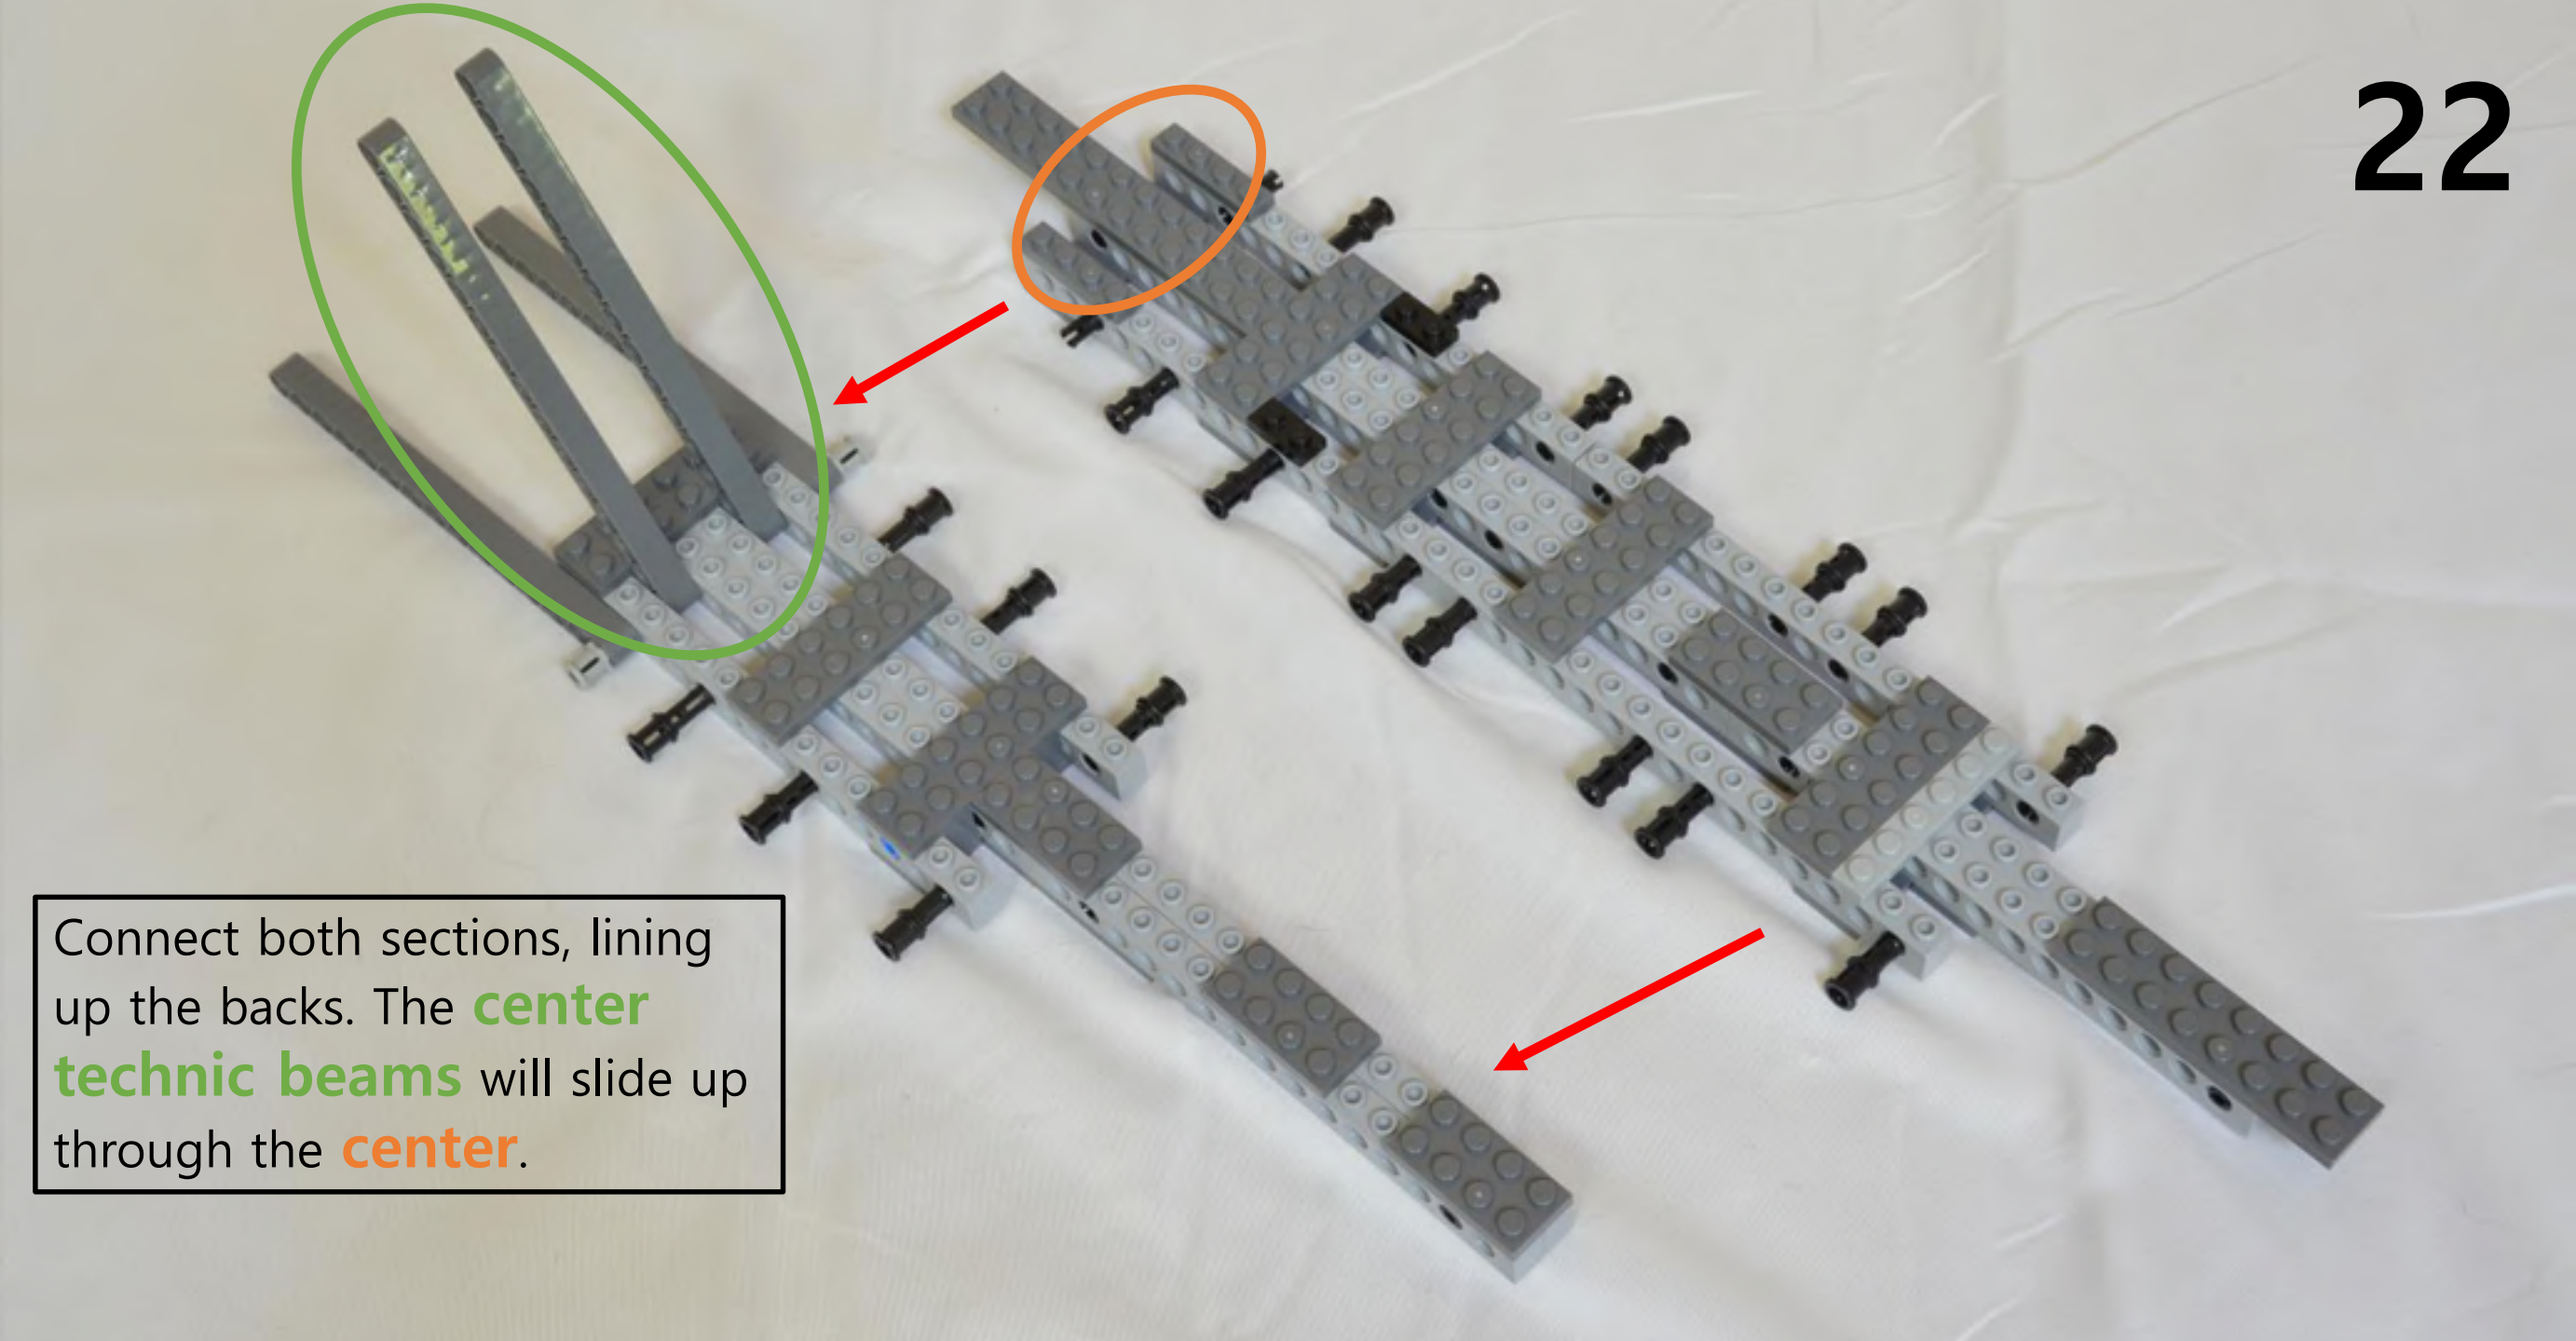


Reattach the technic pins on both sides.

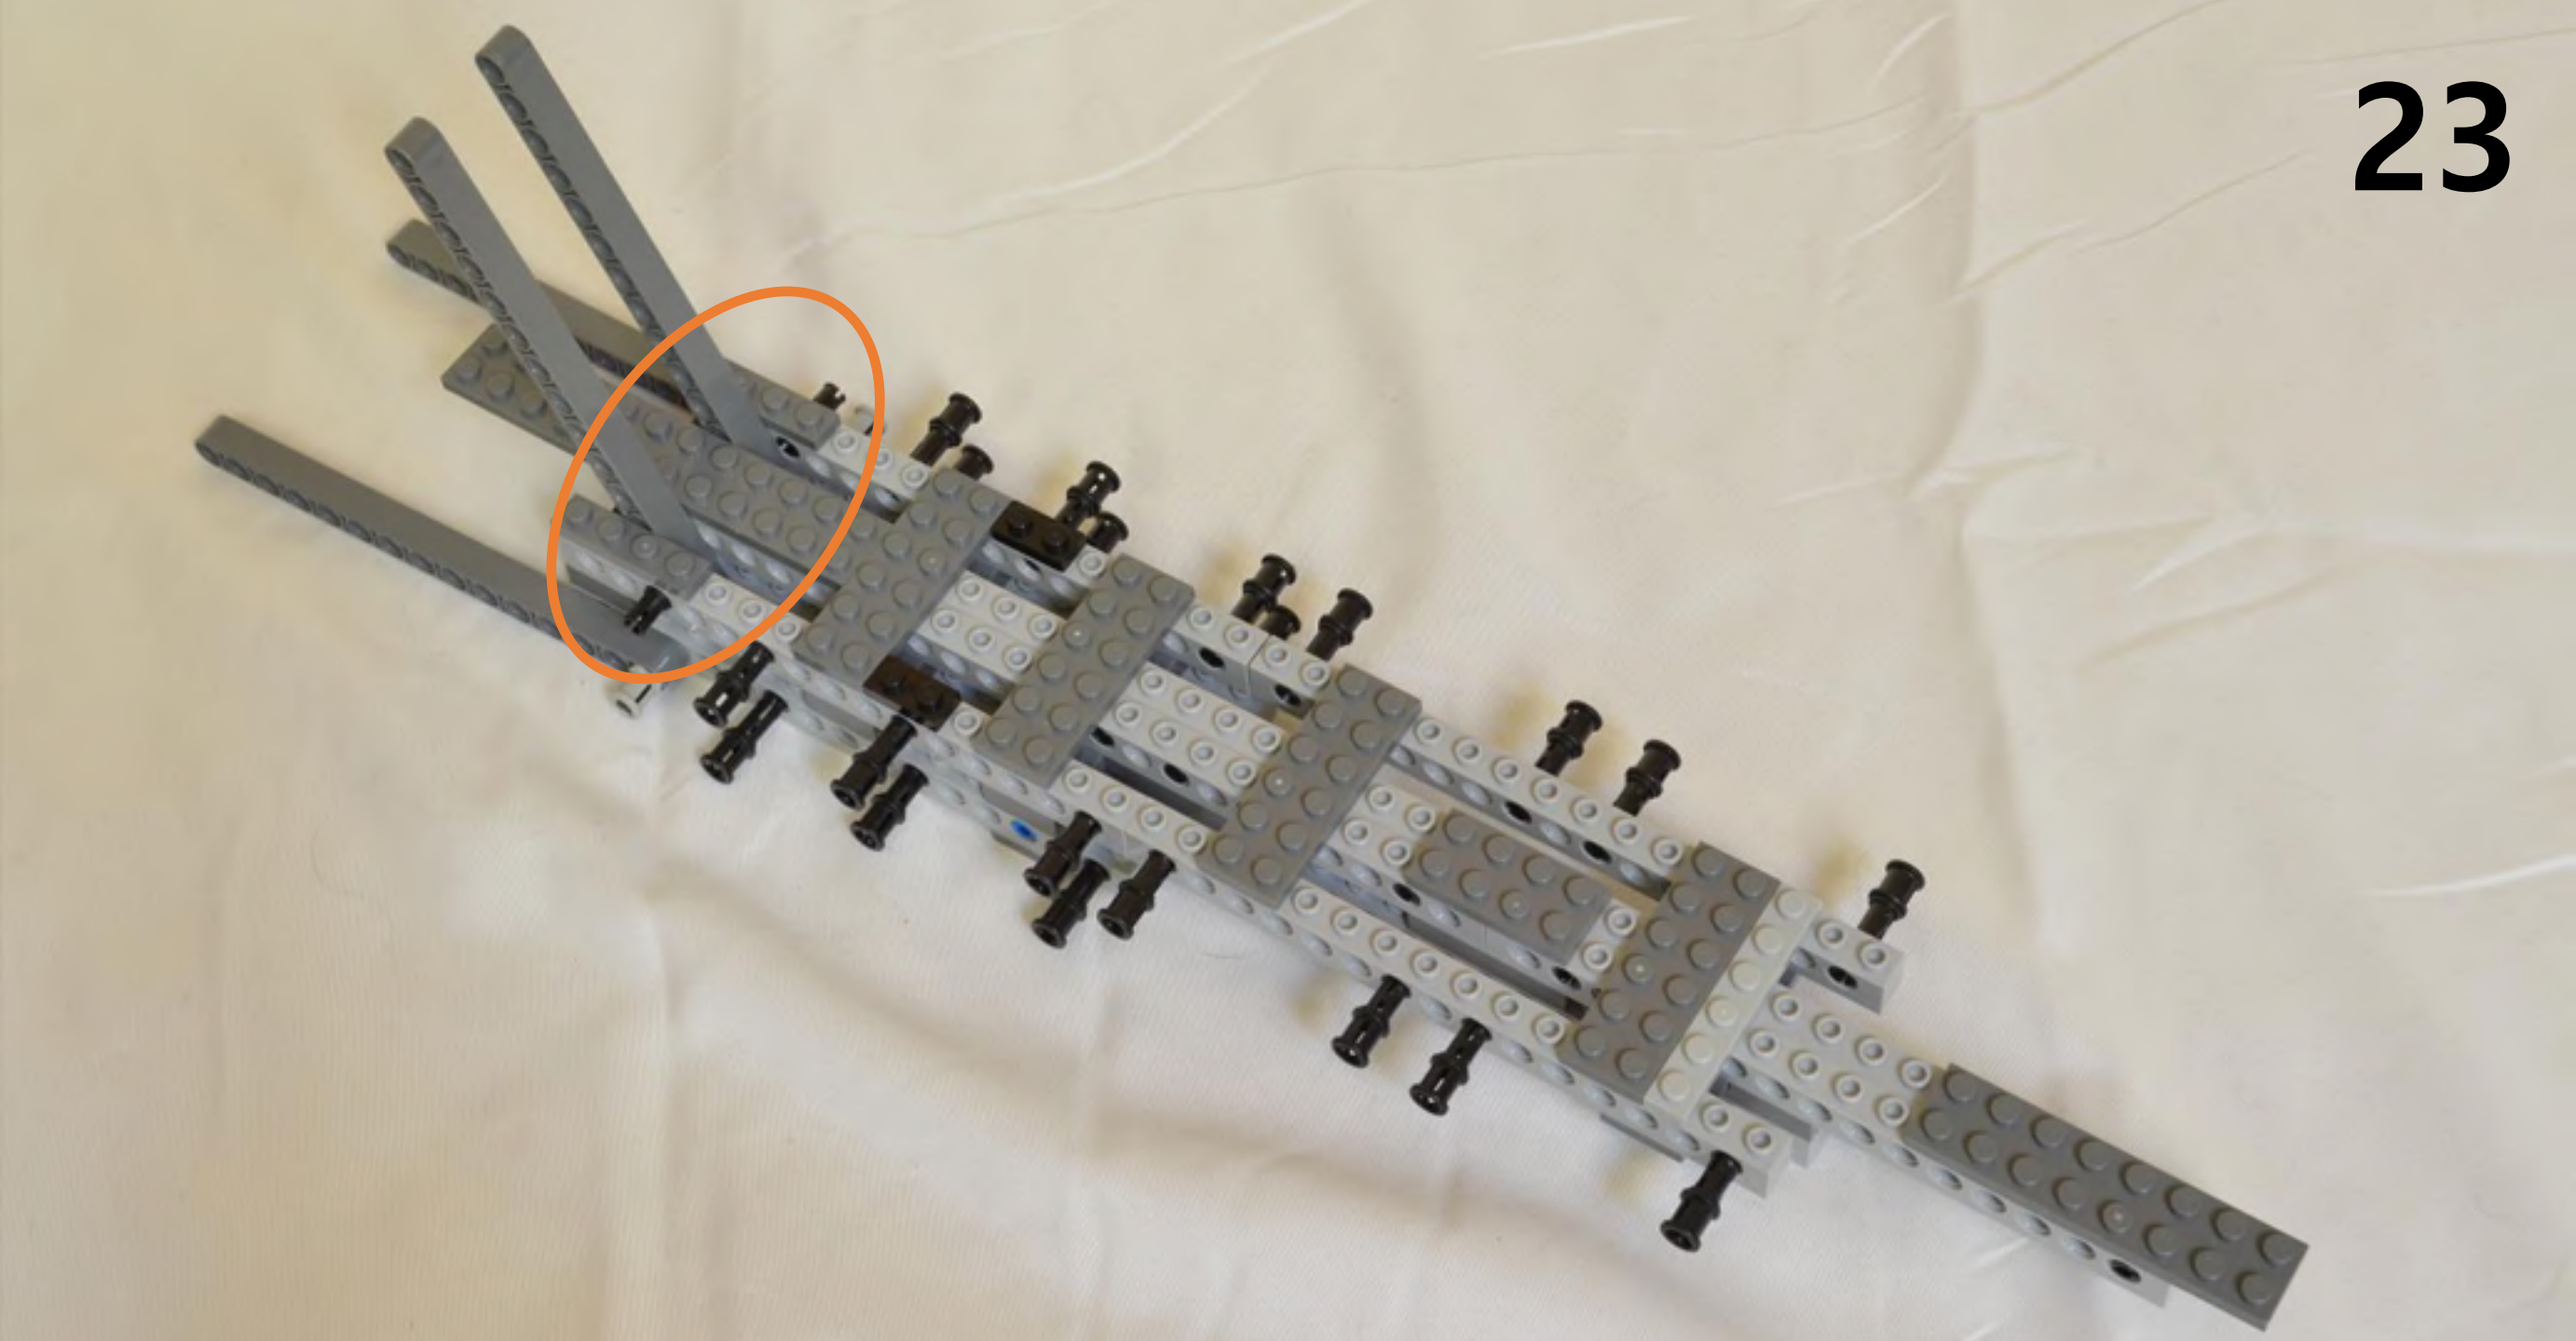


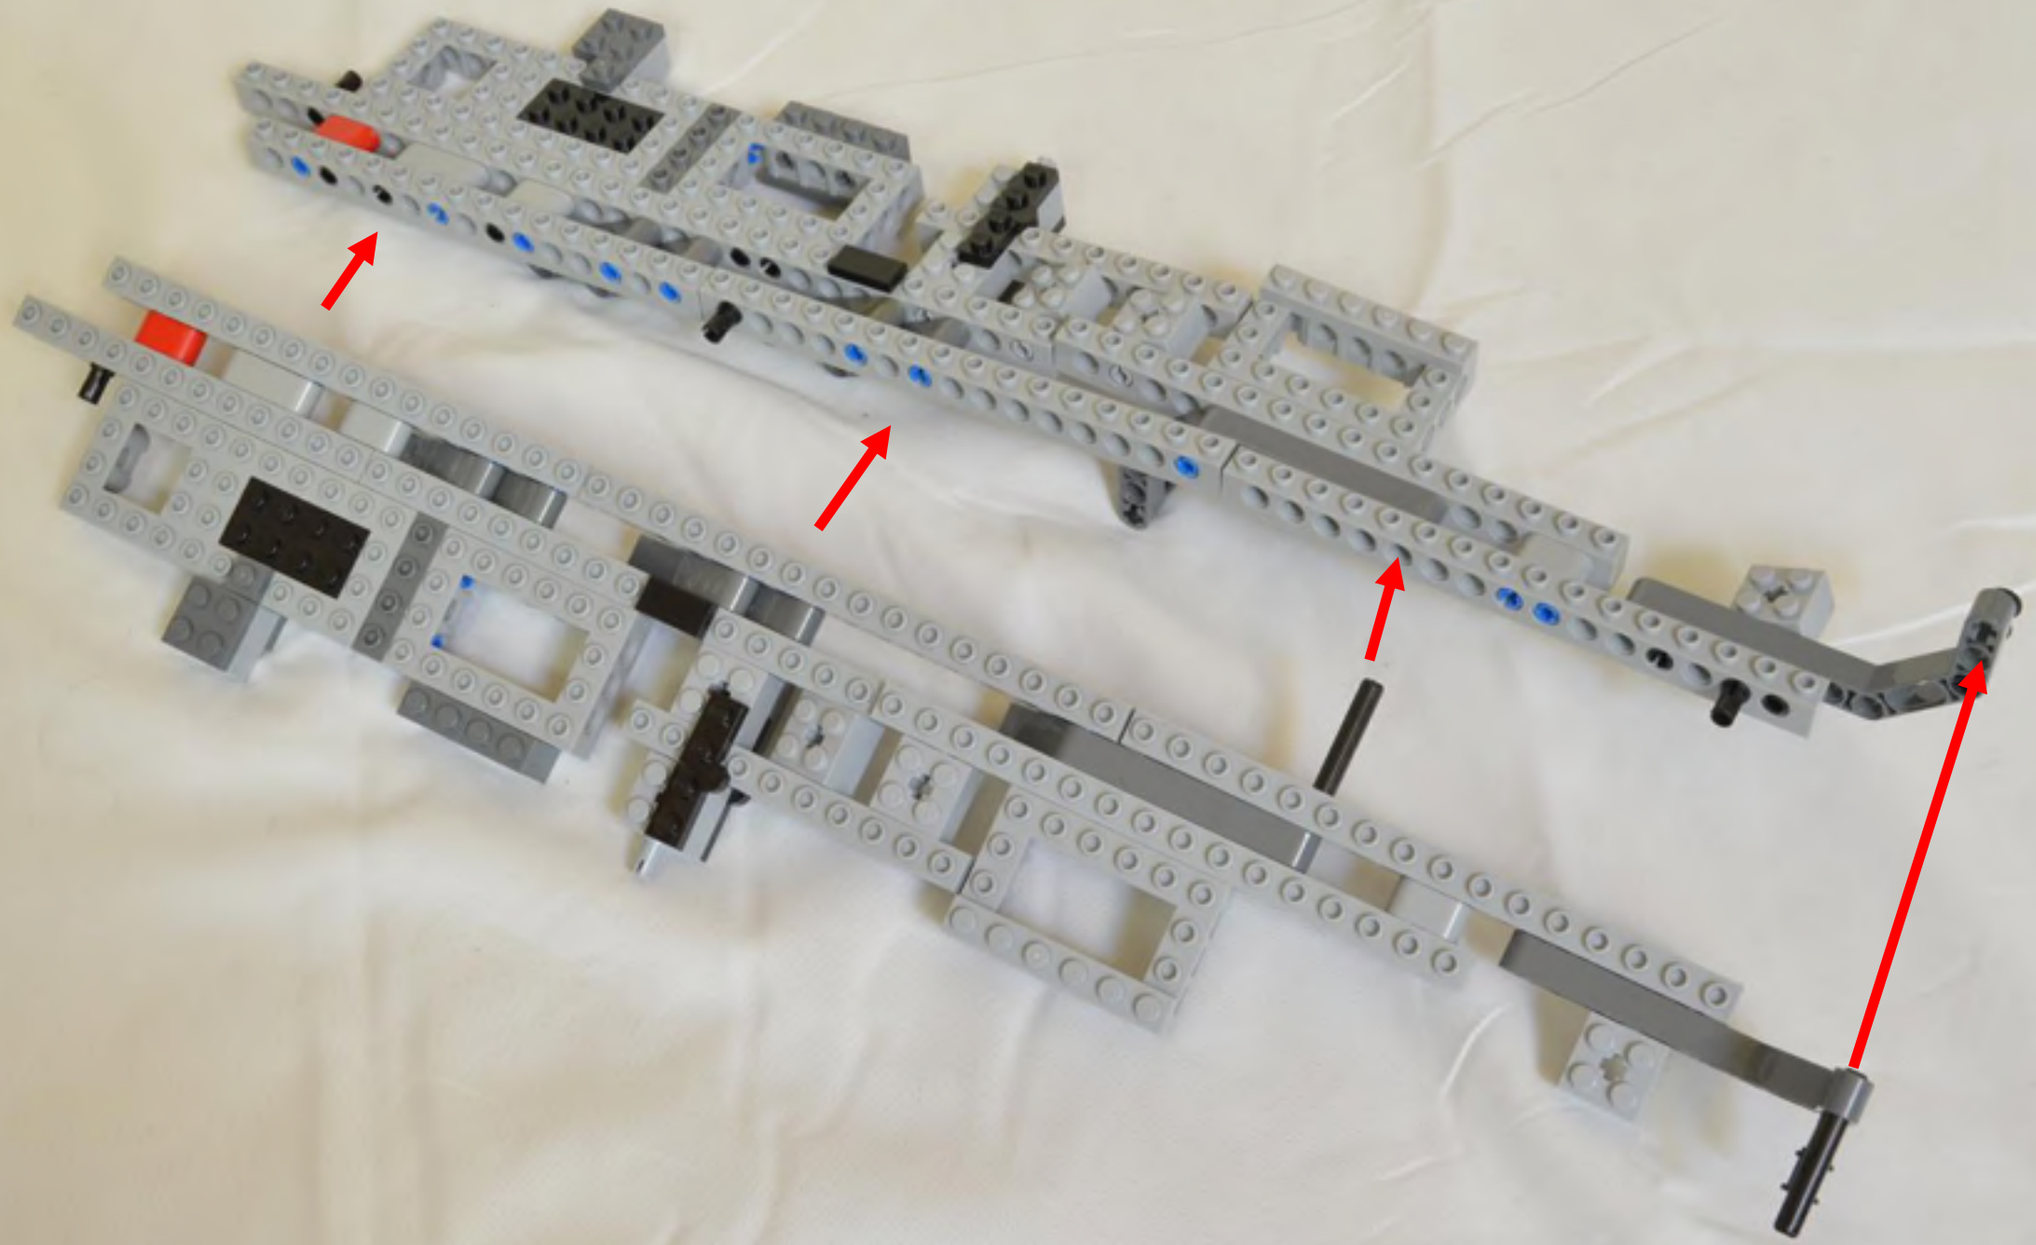
Push in the **specified technic pins** on both sides (eight pins total).

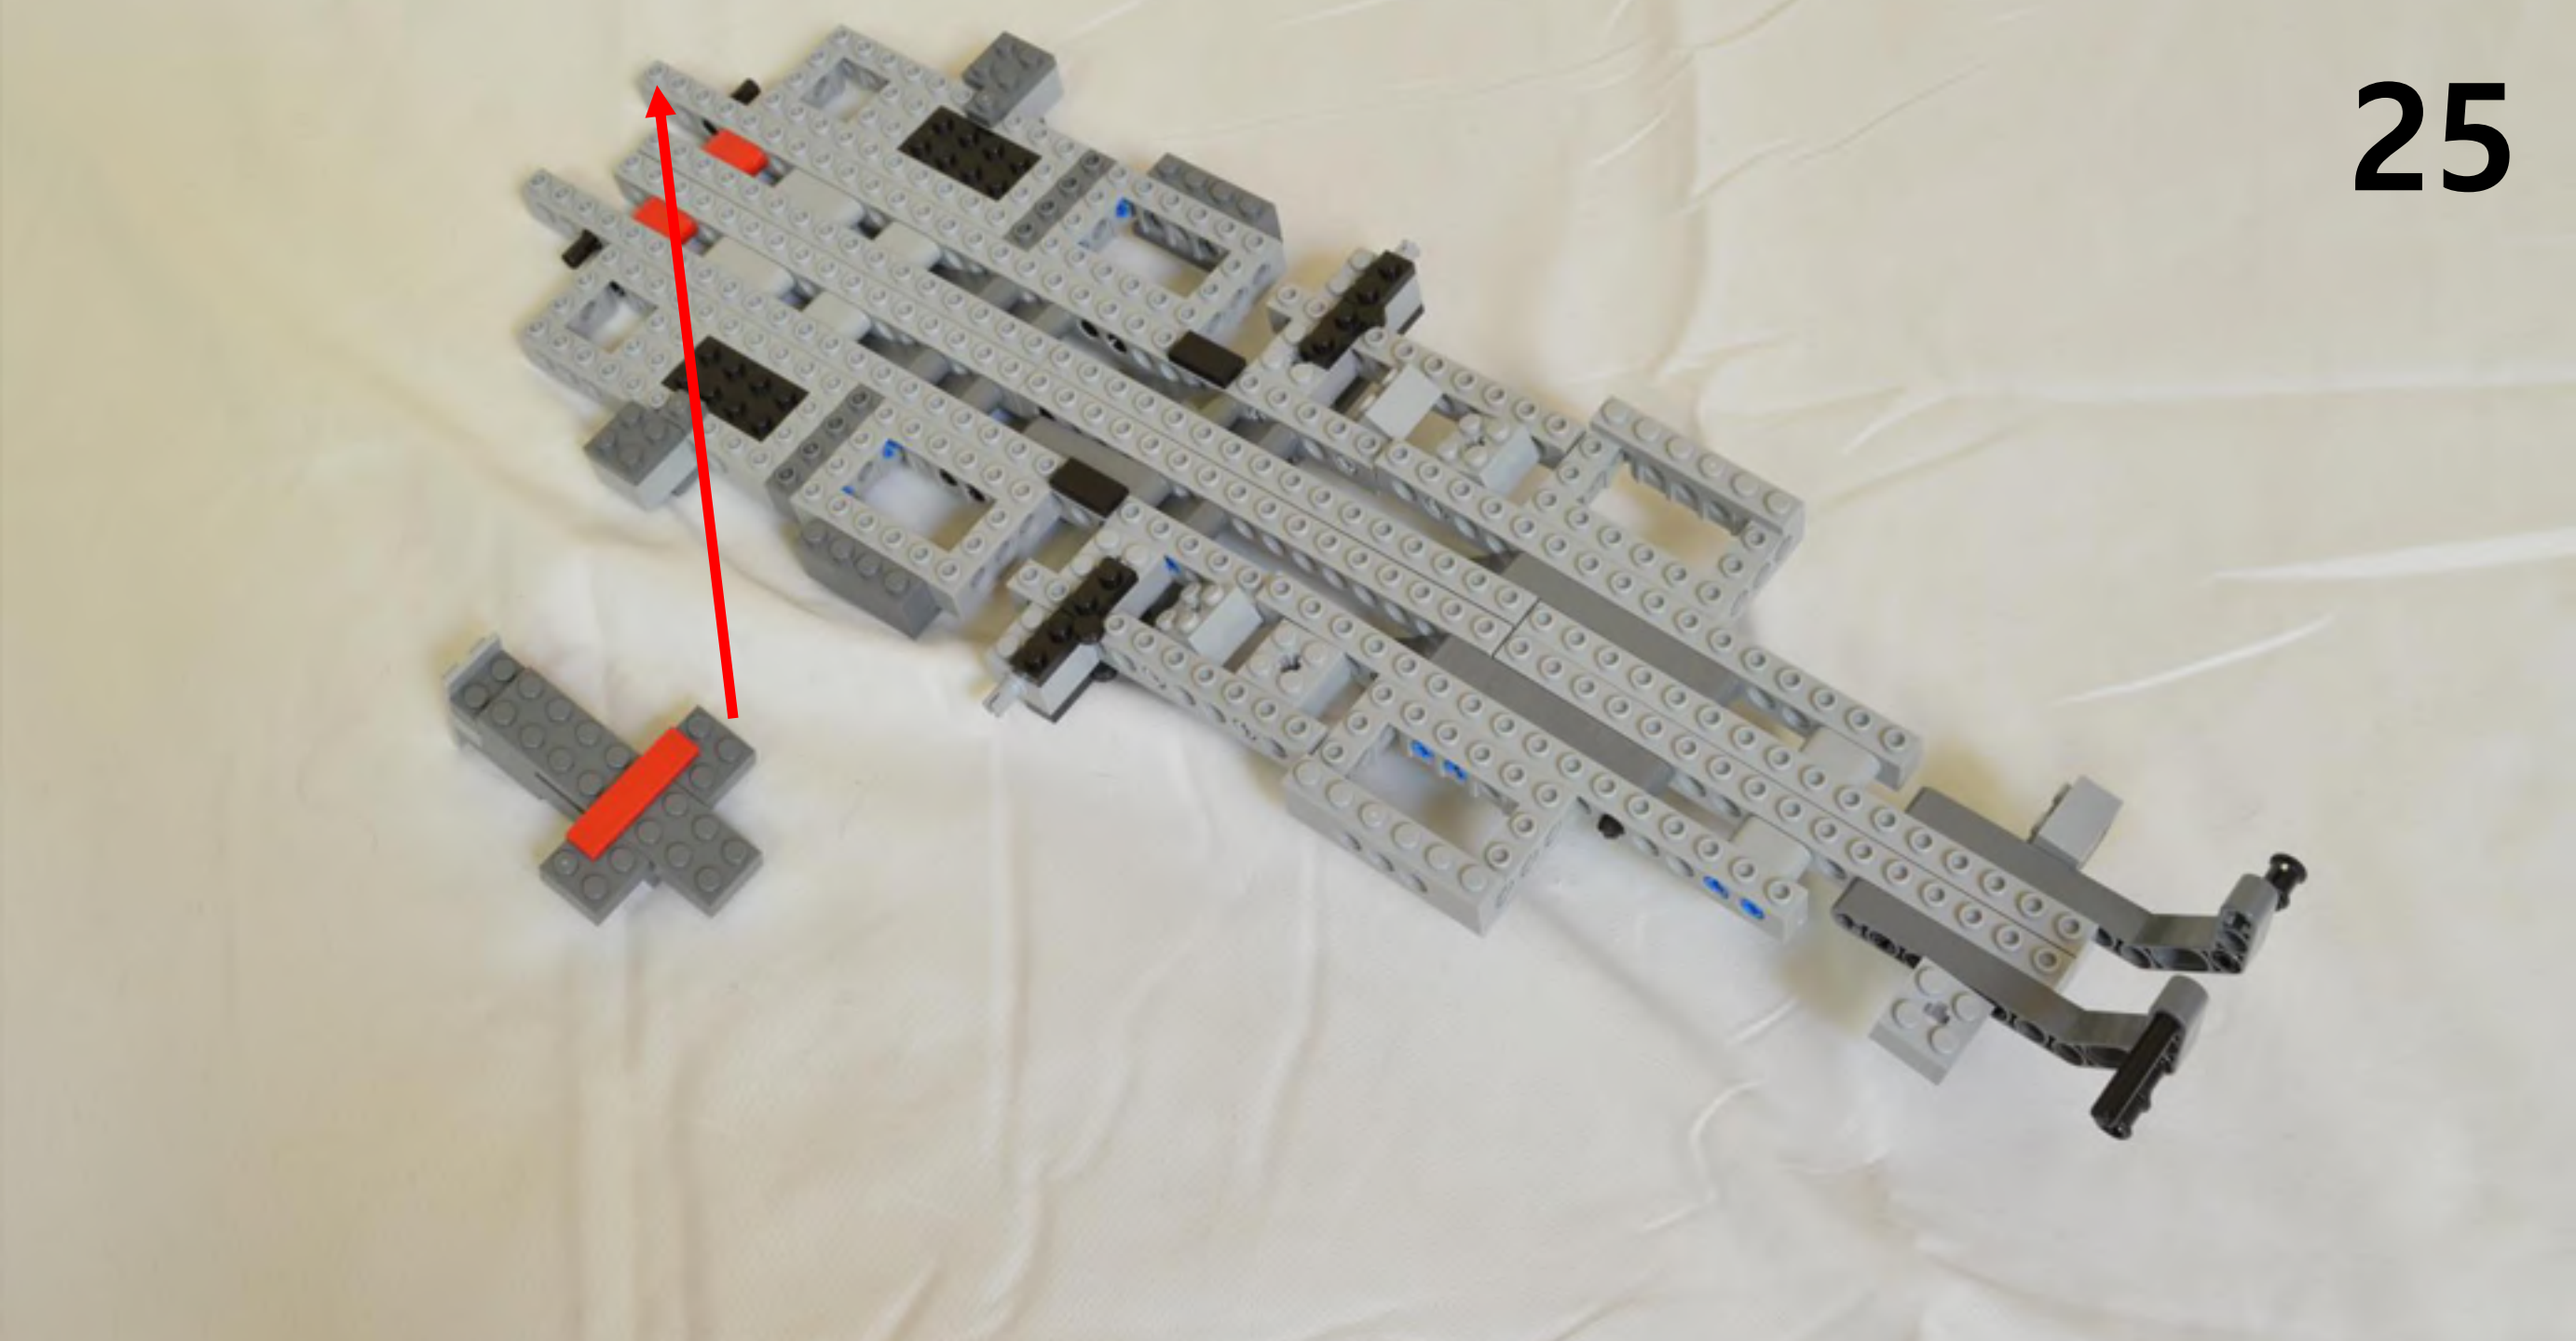


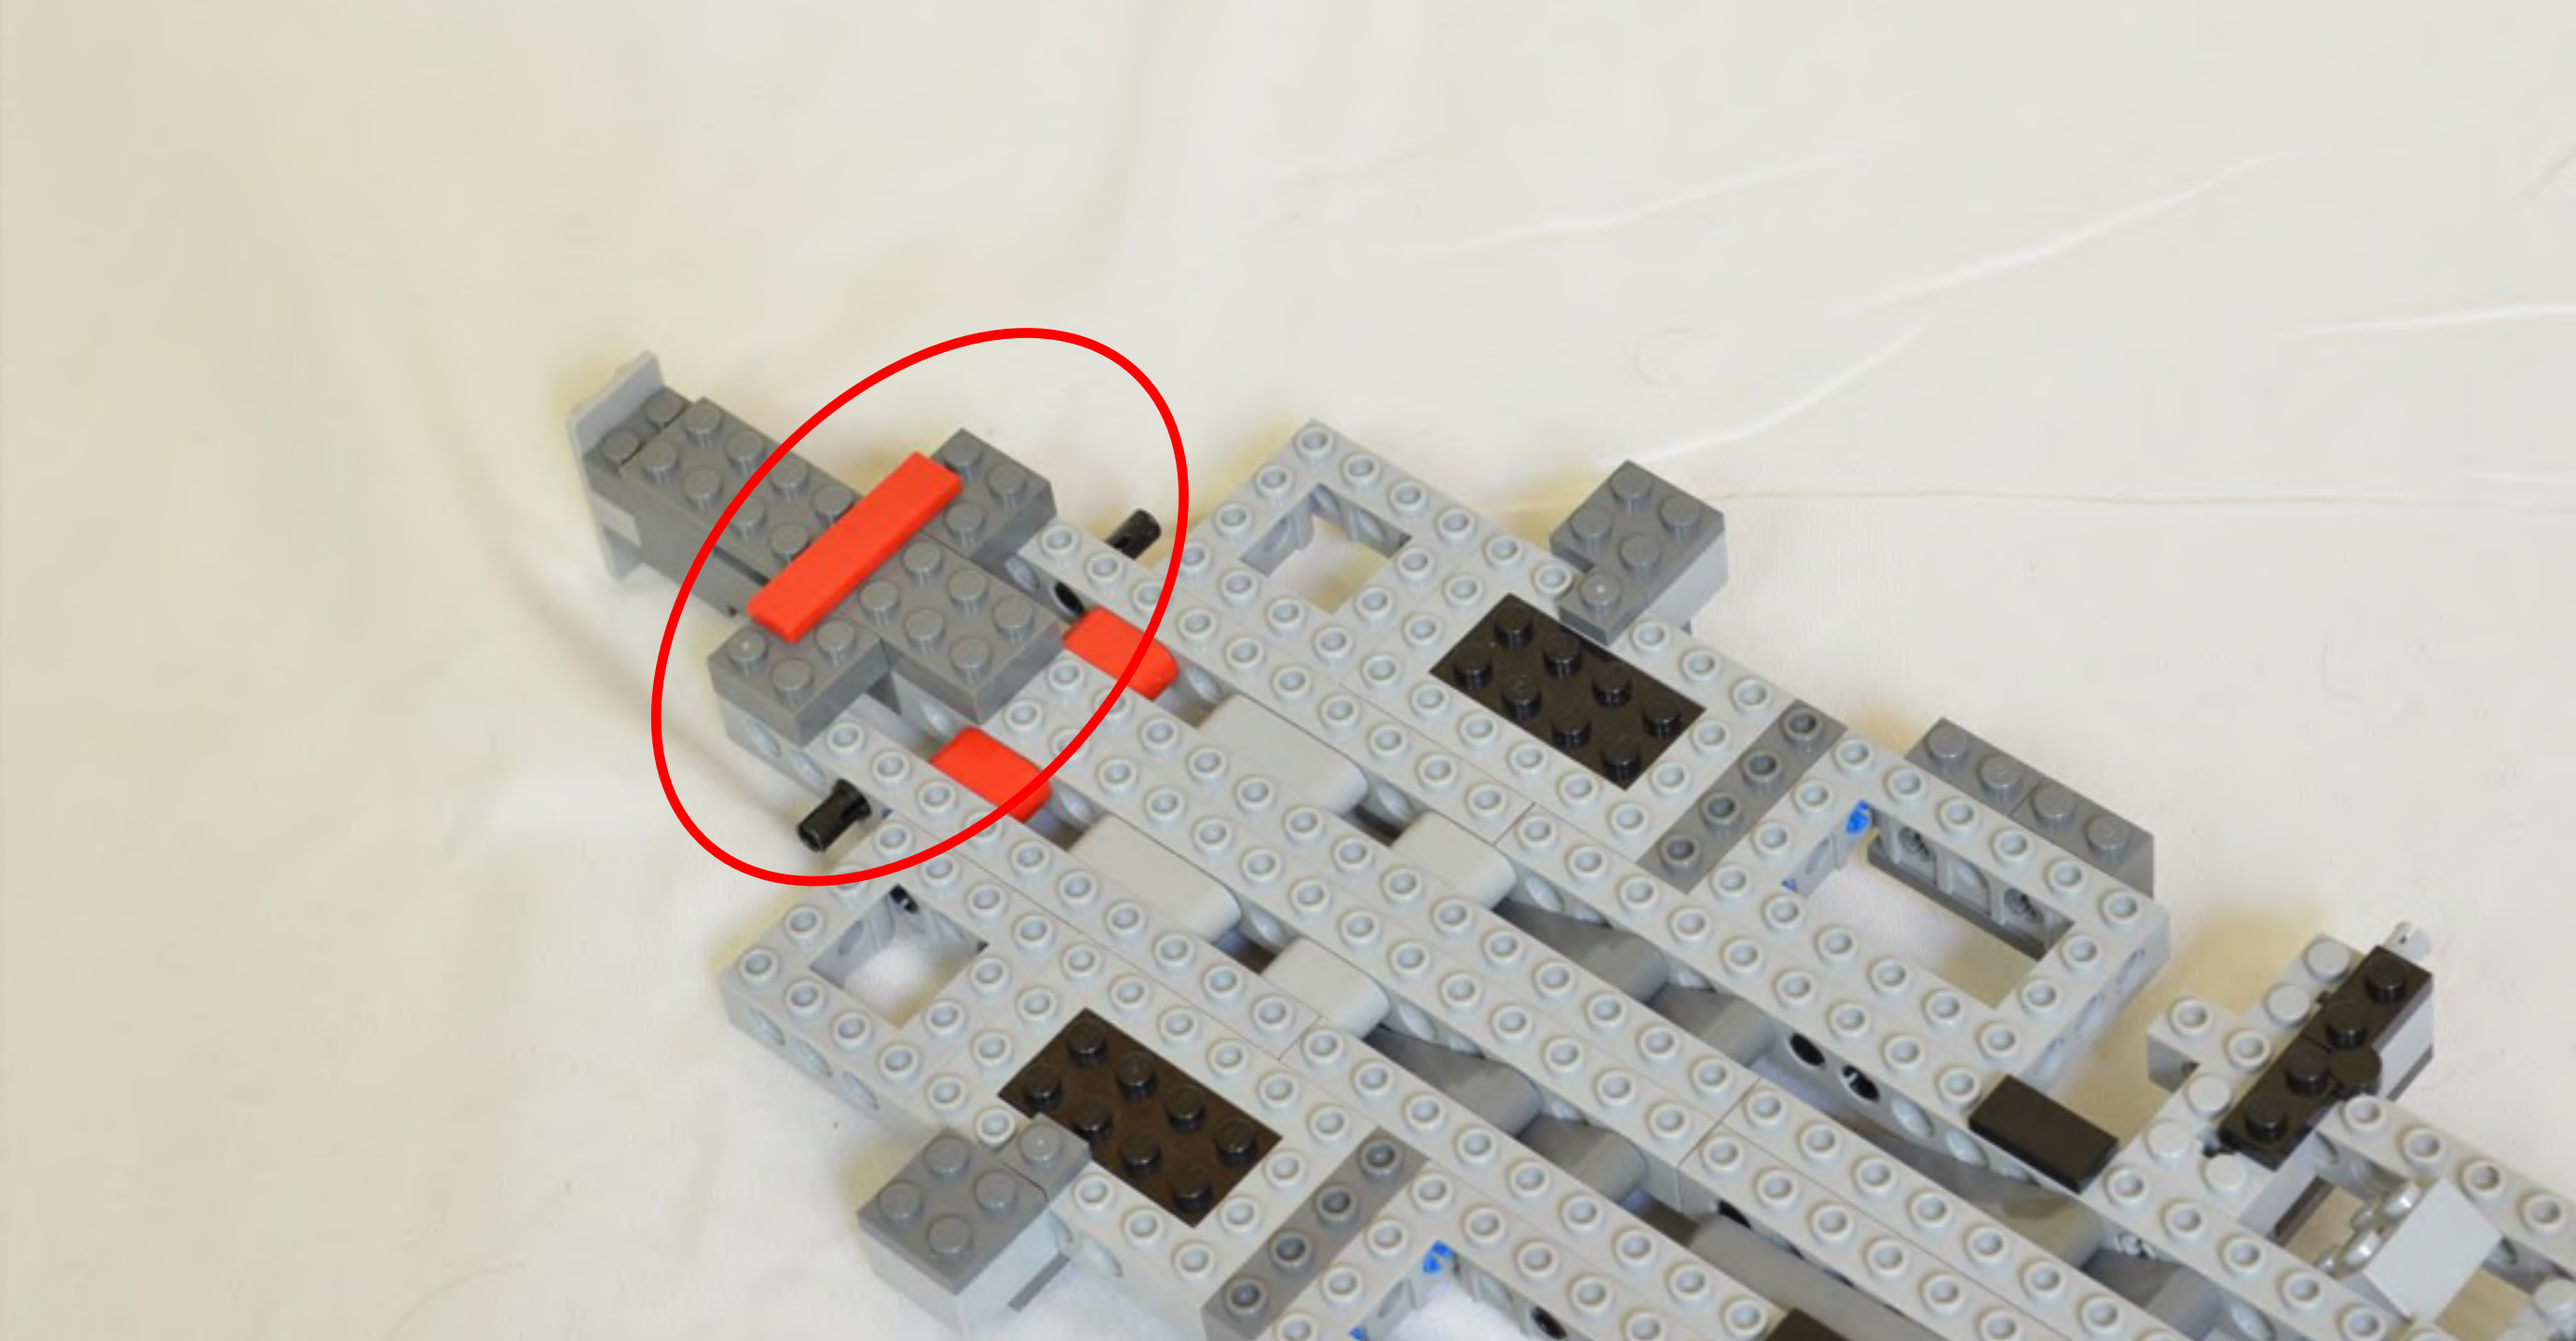


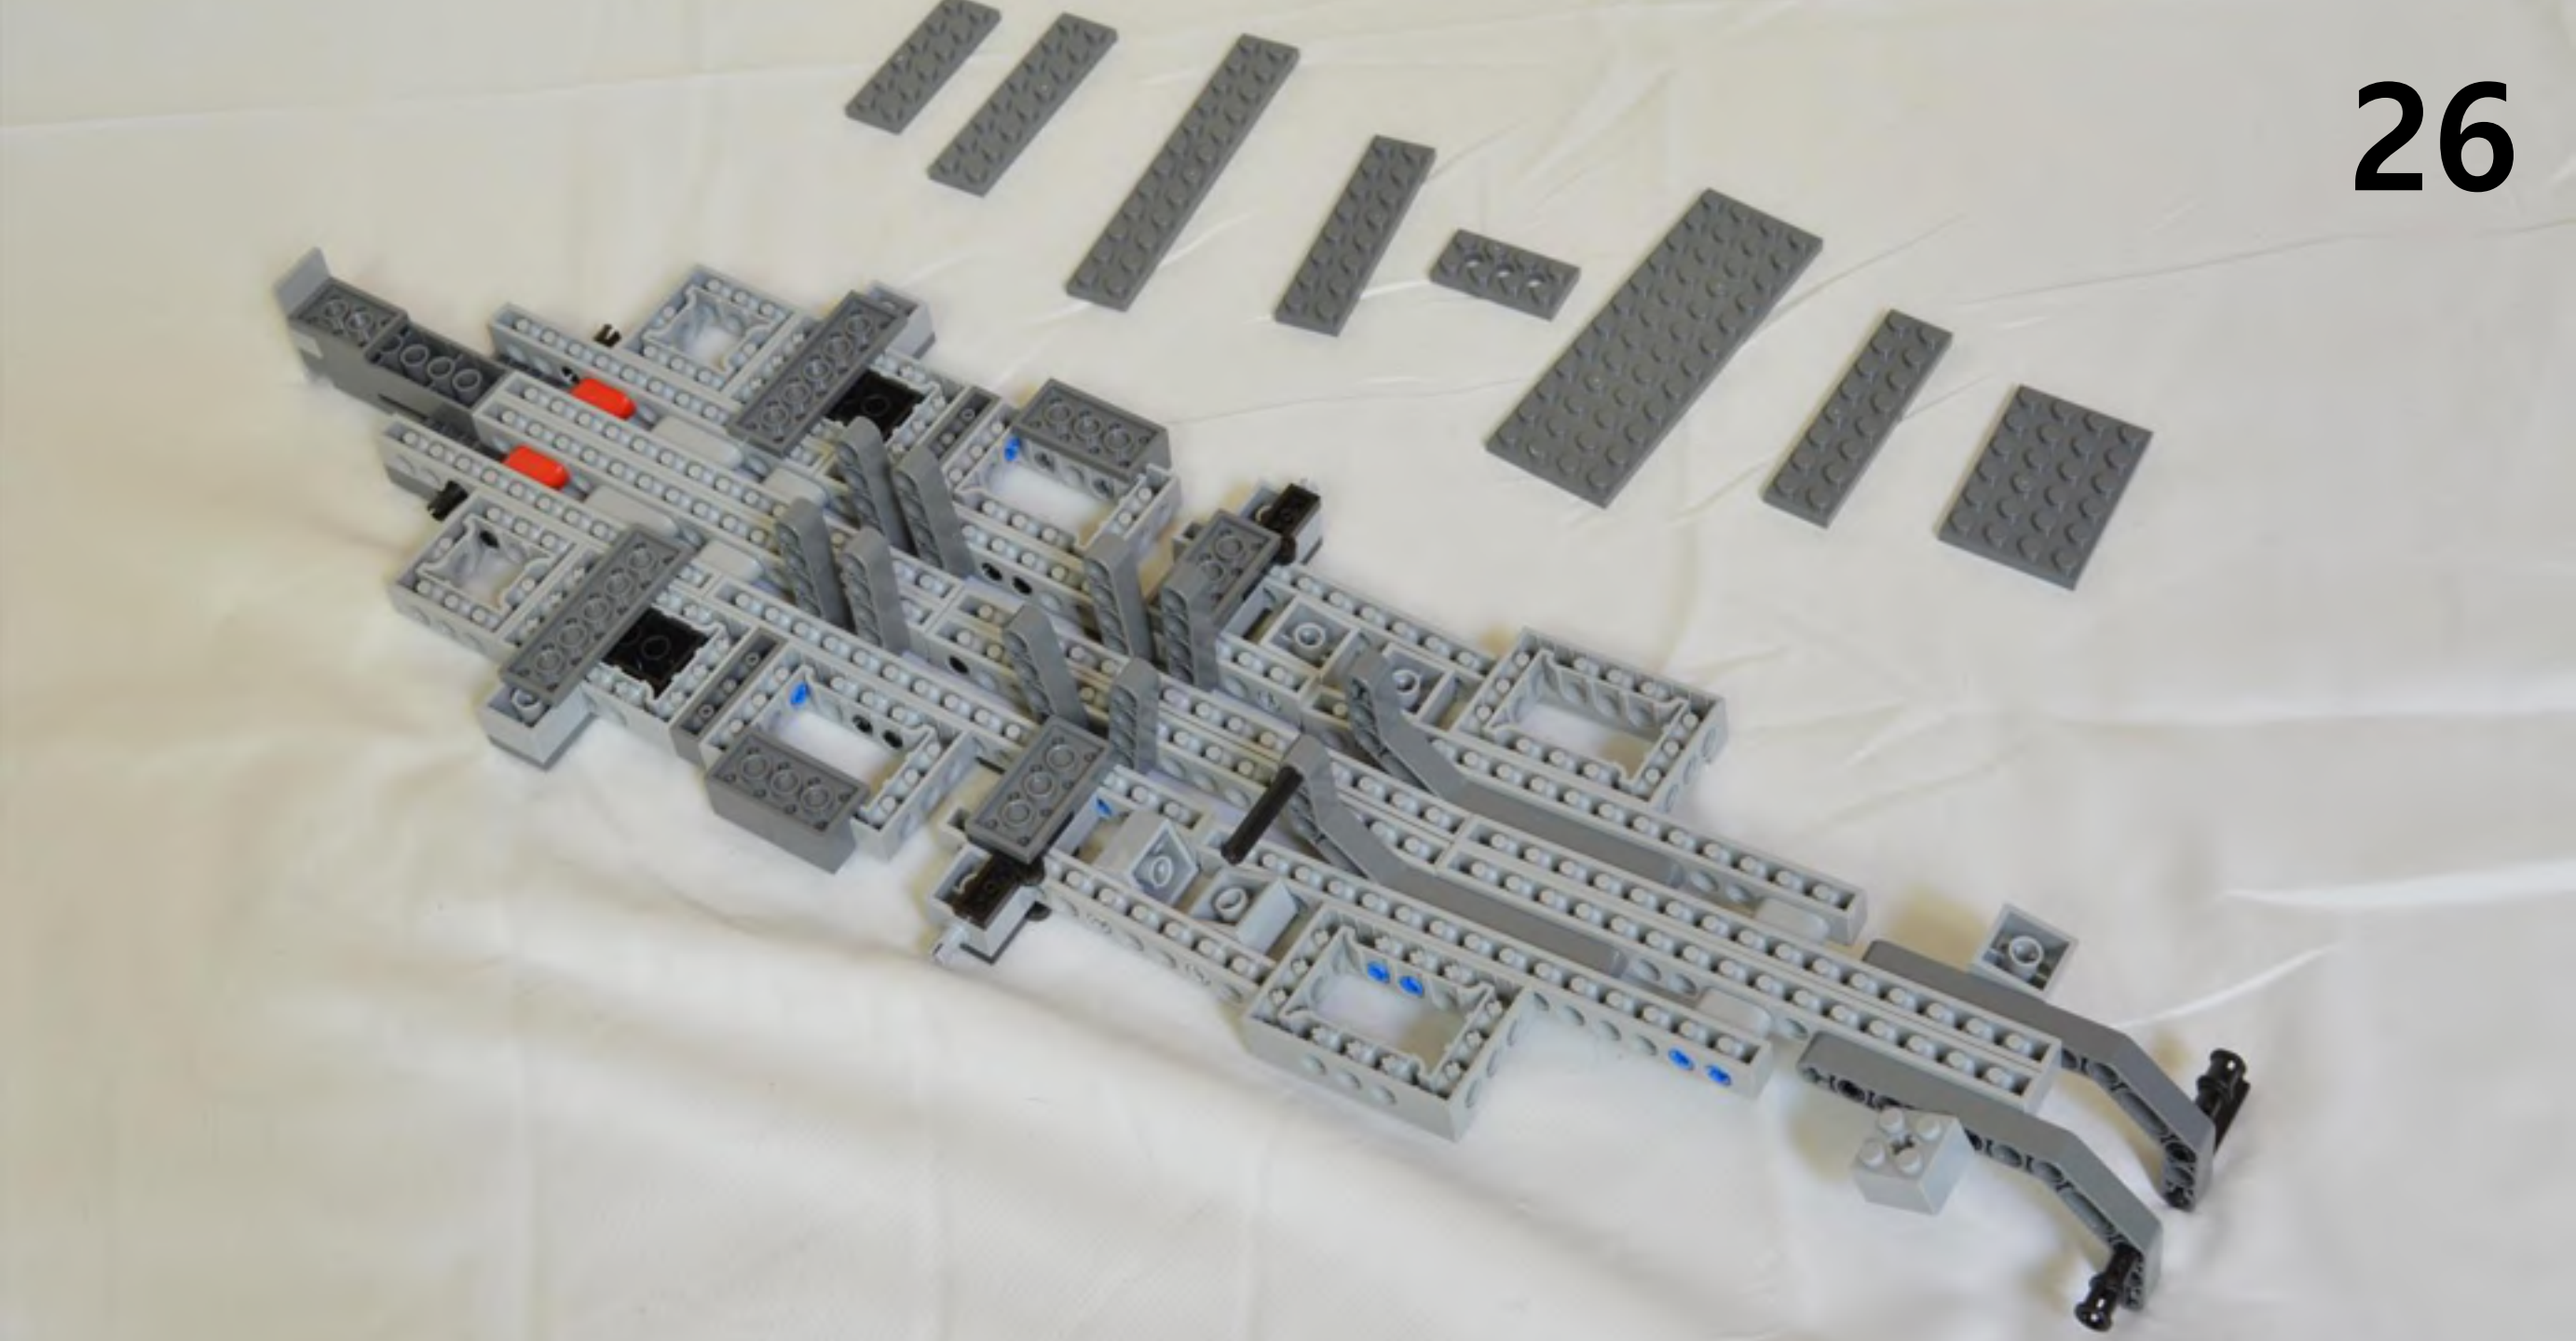
Connect both sections, lining up the backs. The **center technic beams** will slide up through the **center**.

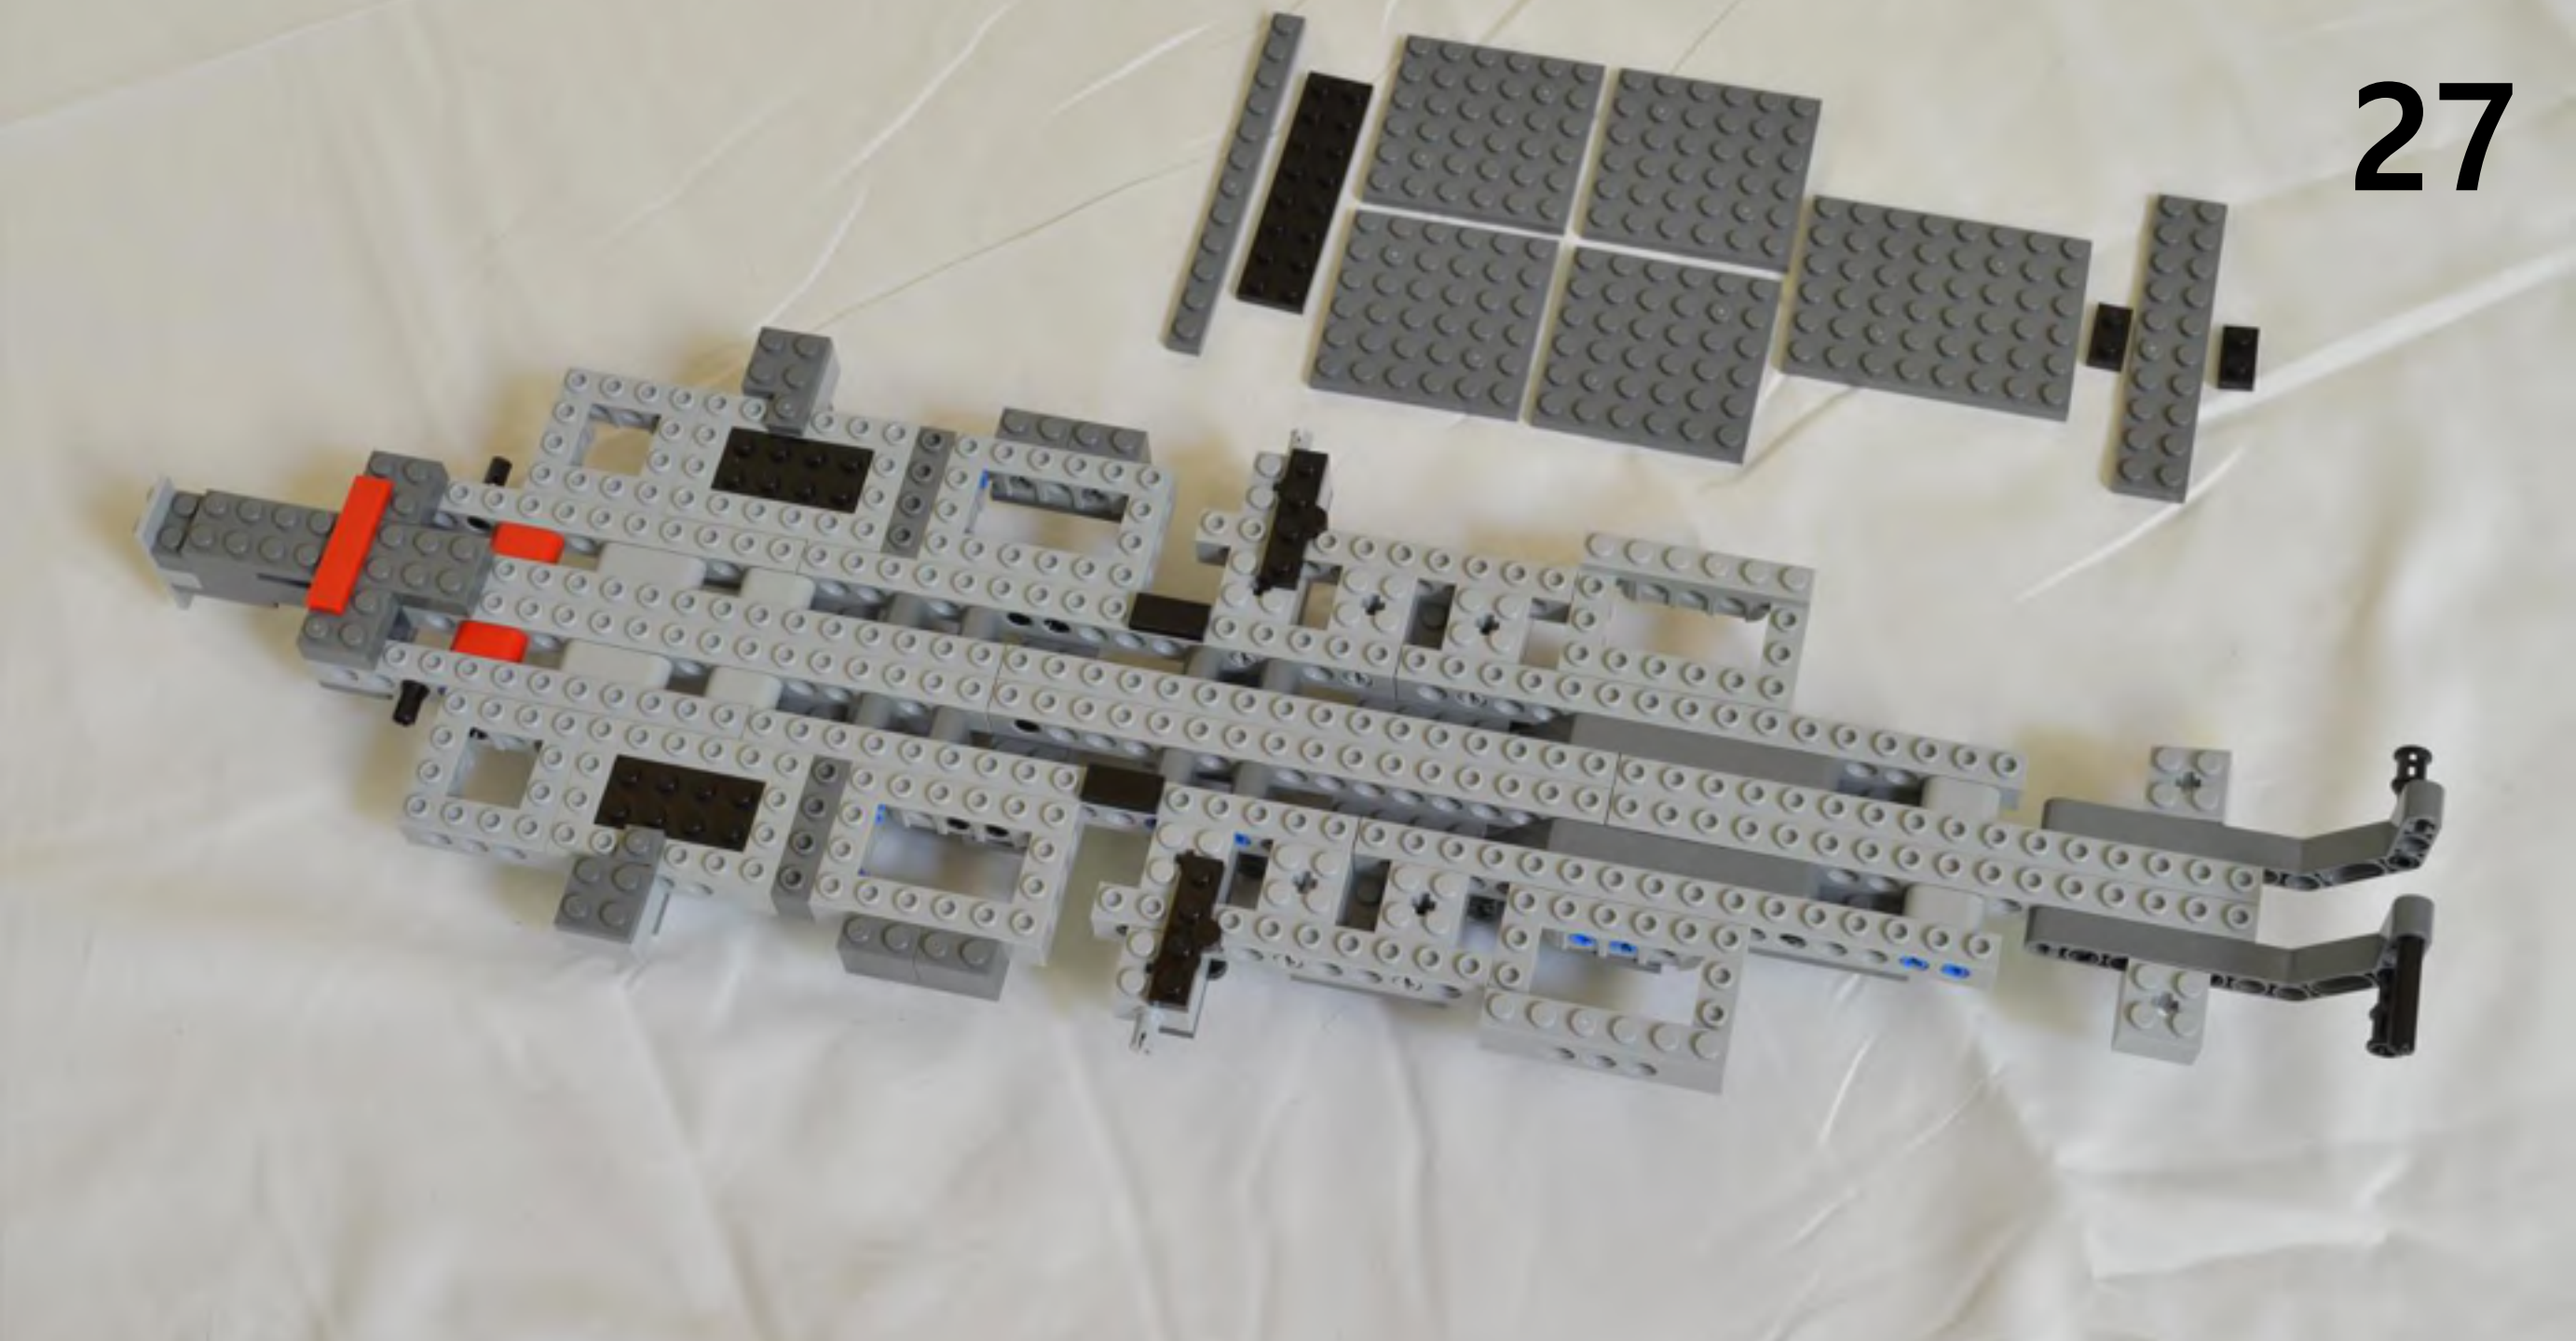


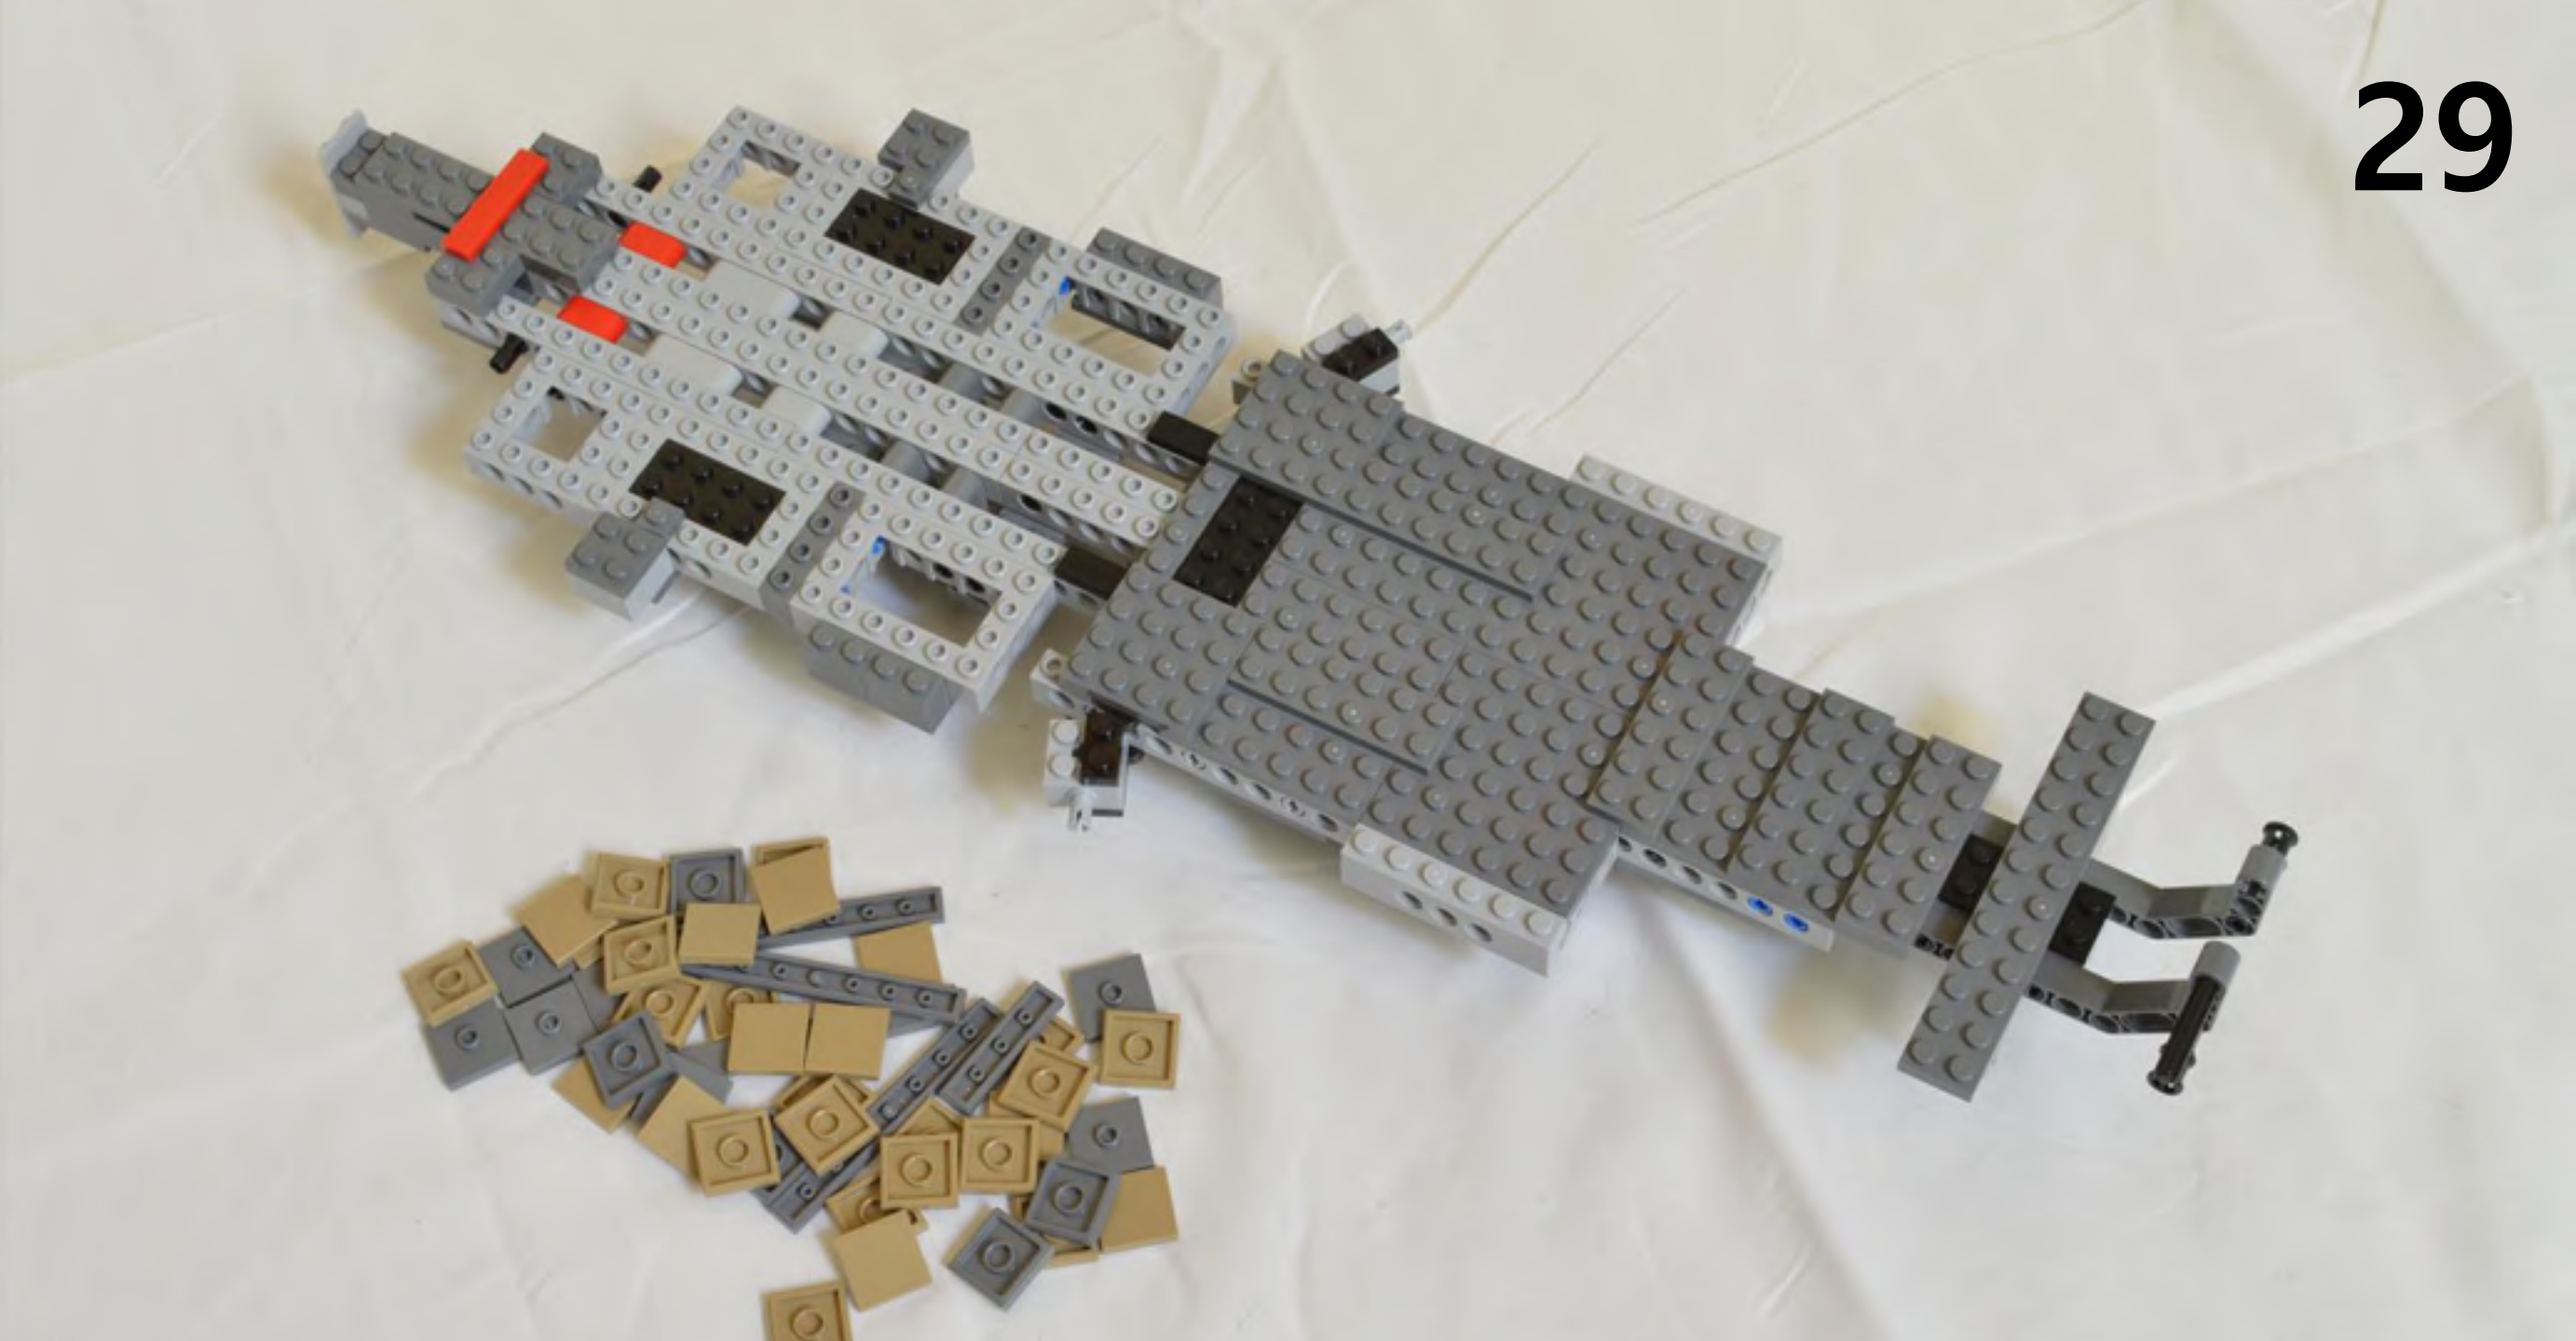


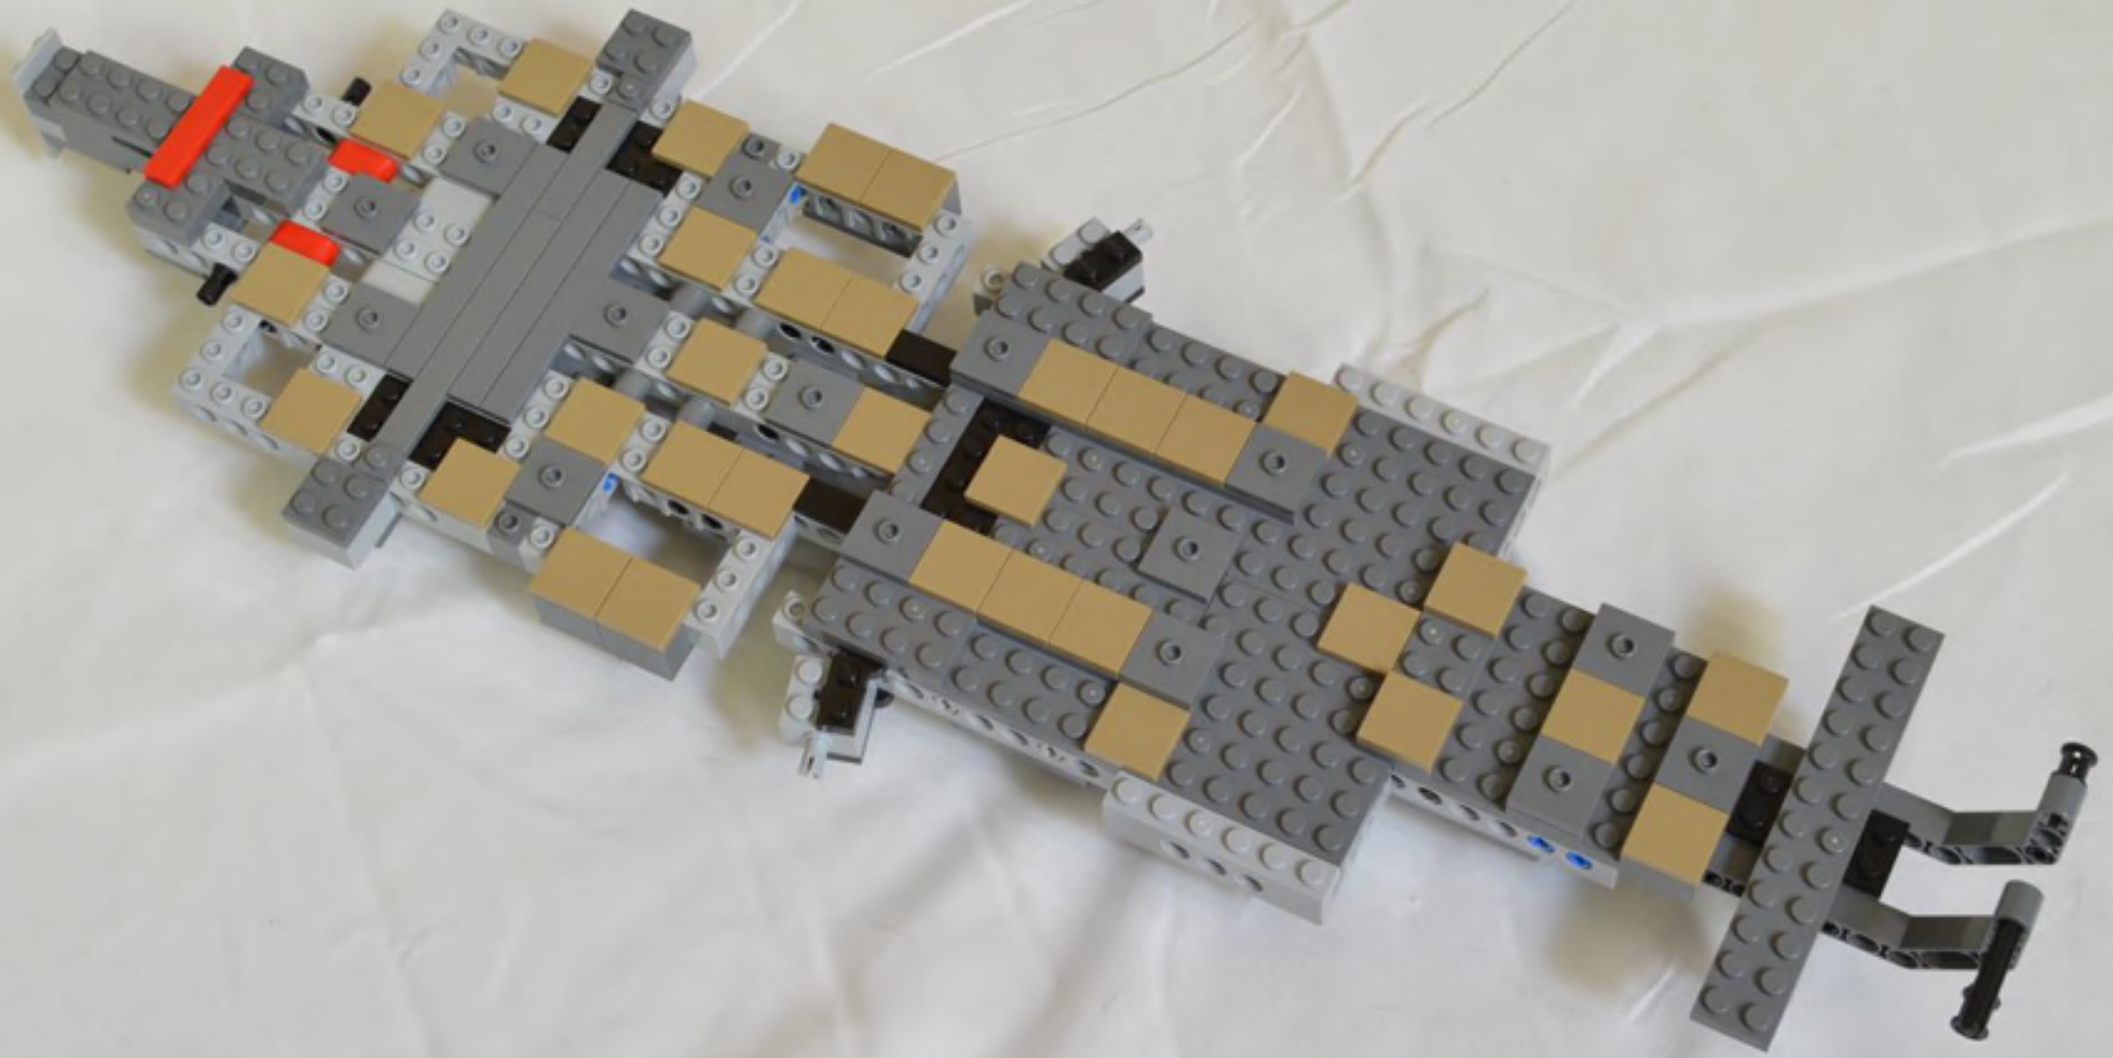


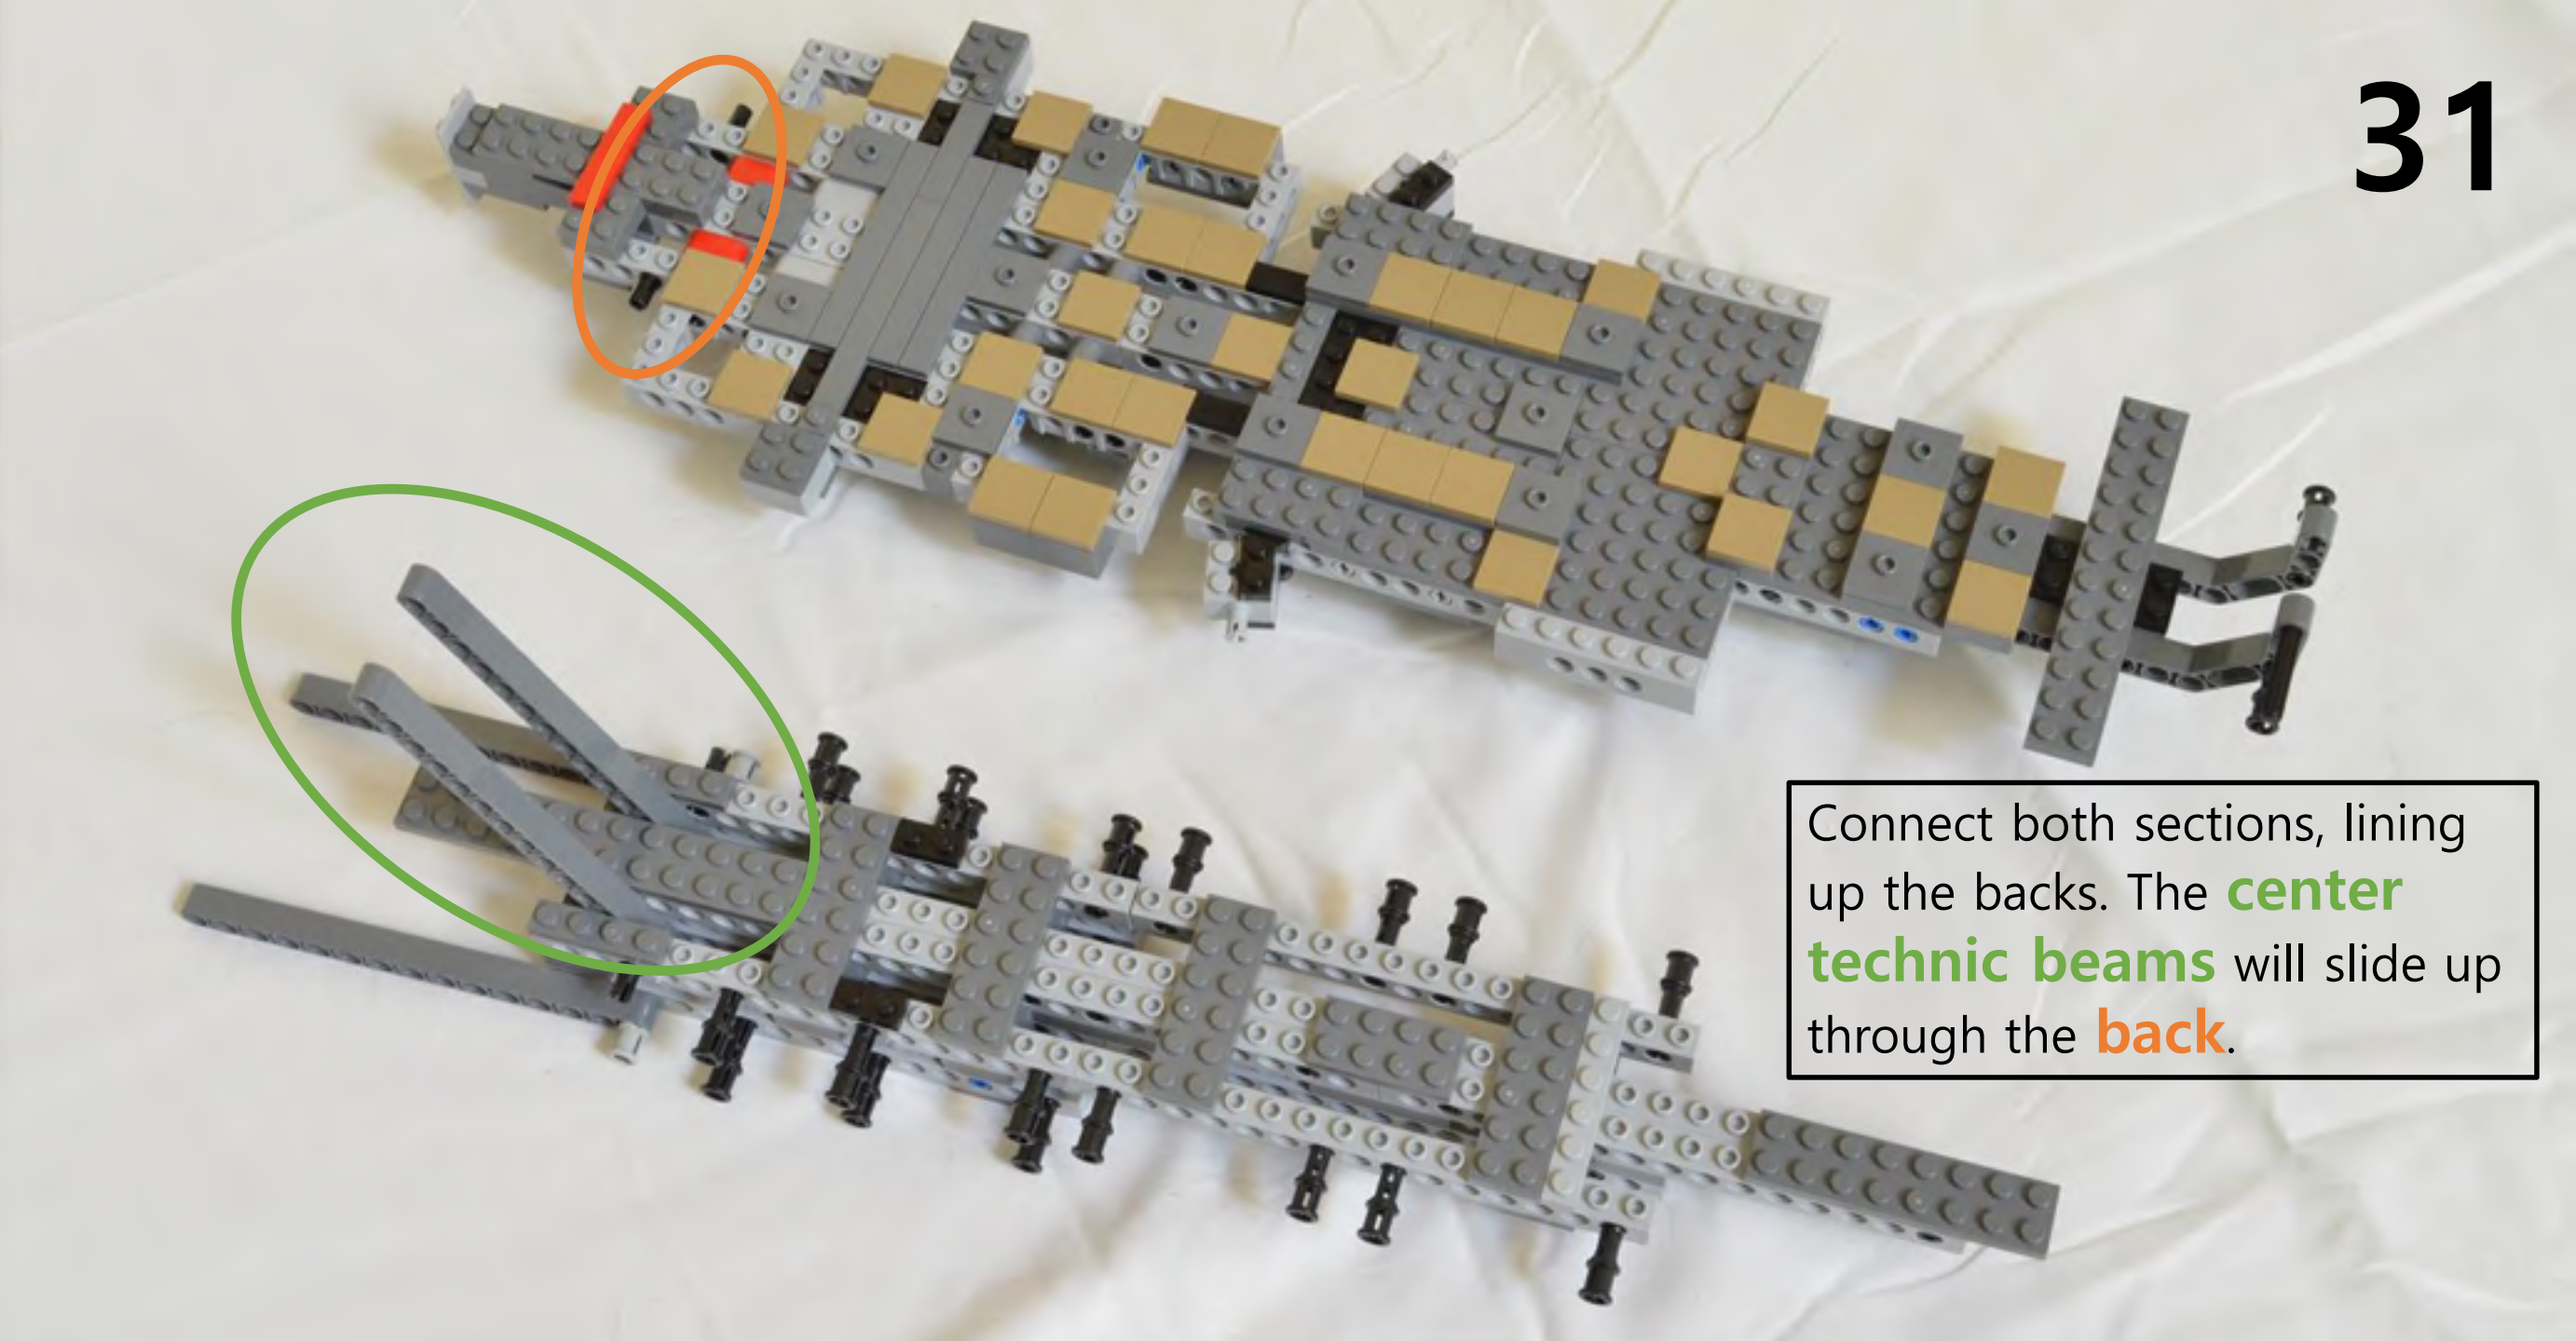




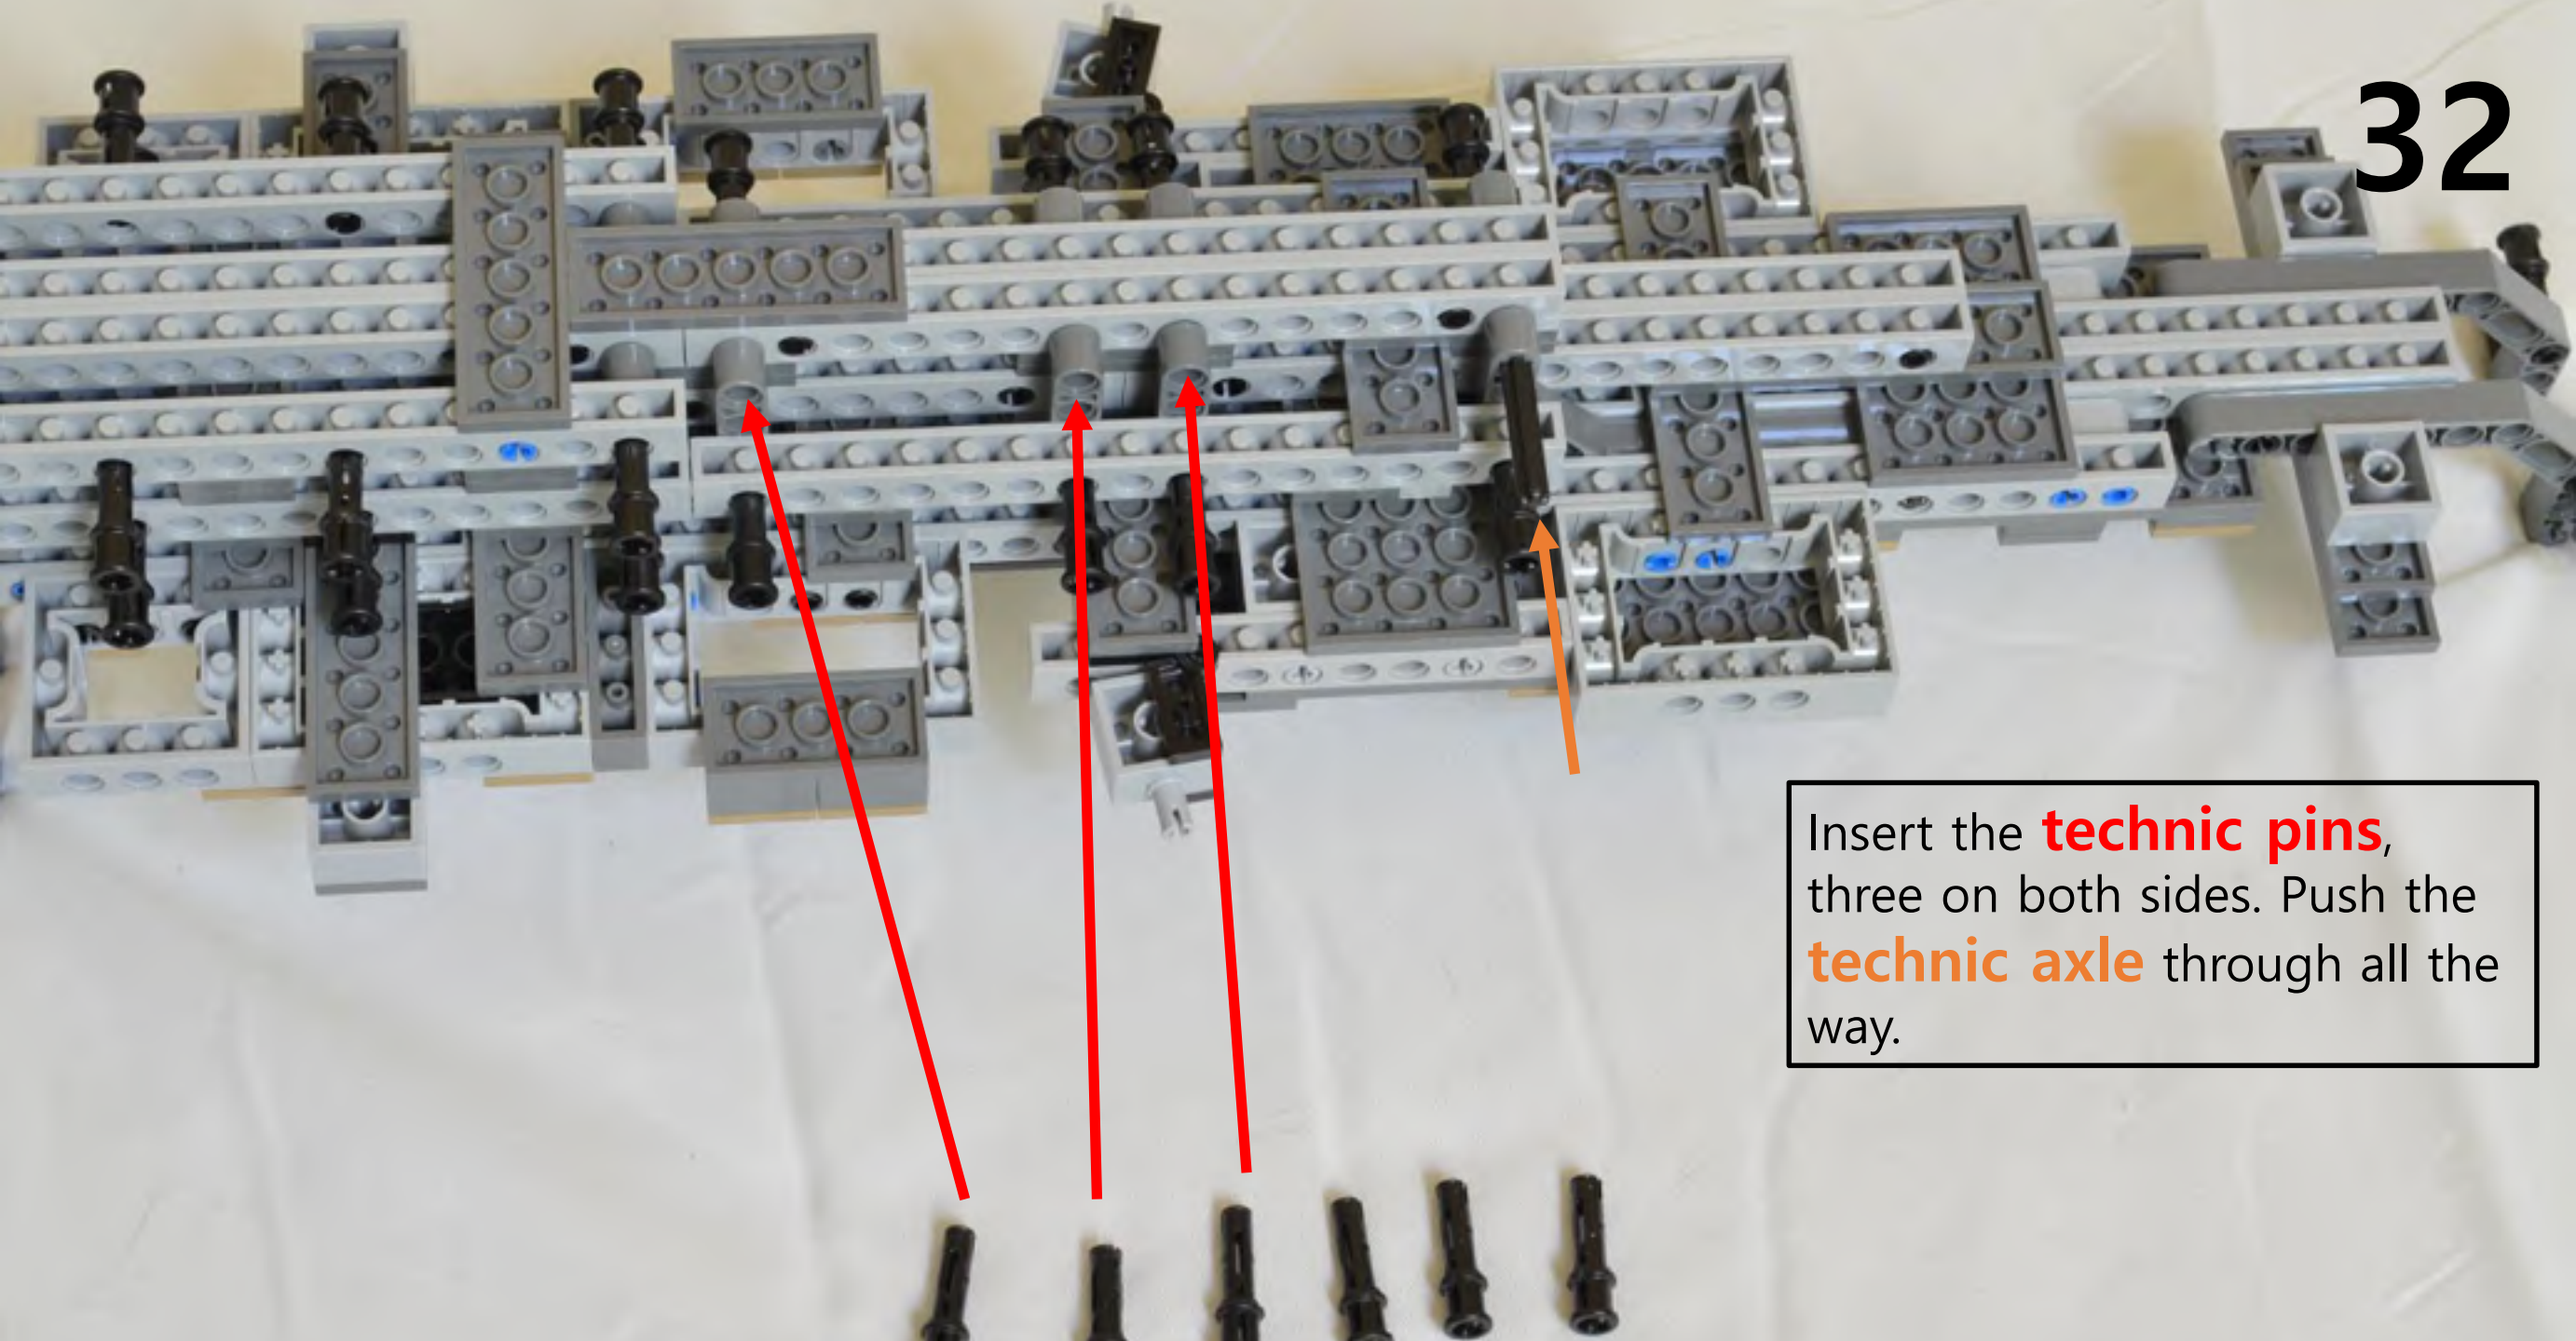




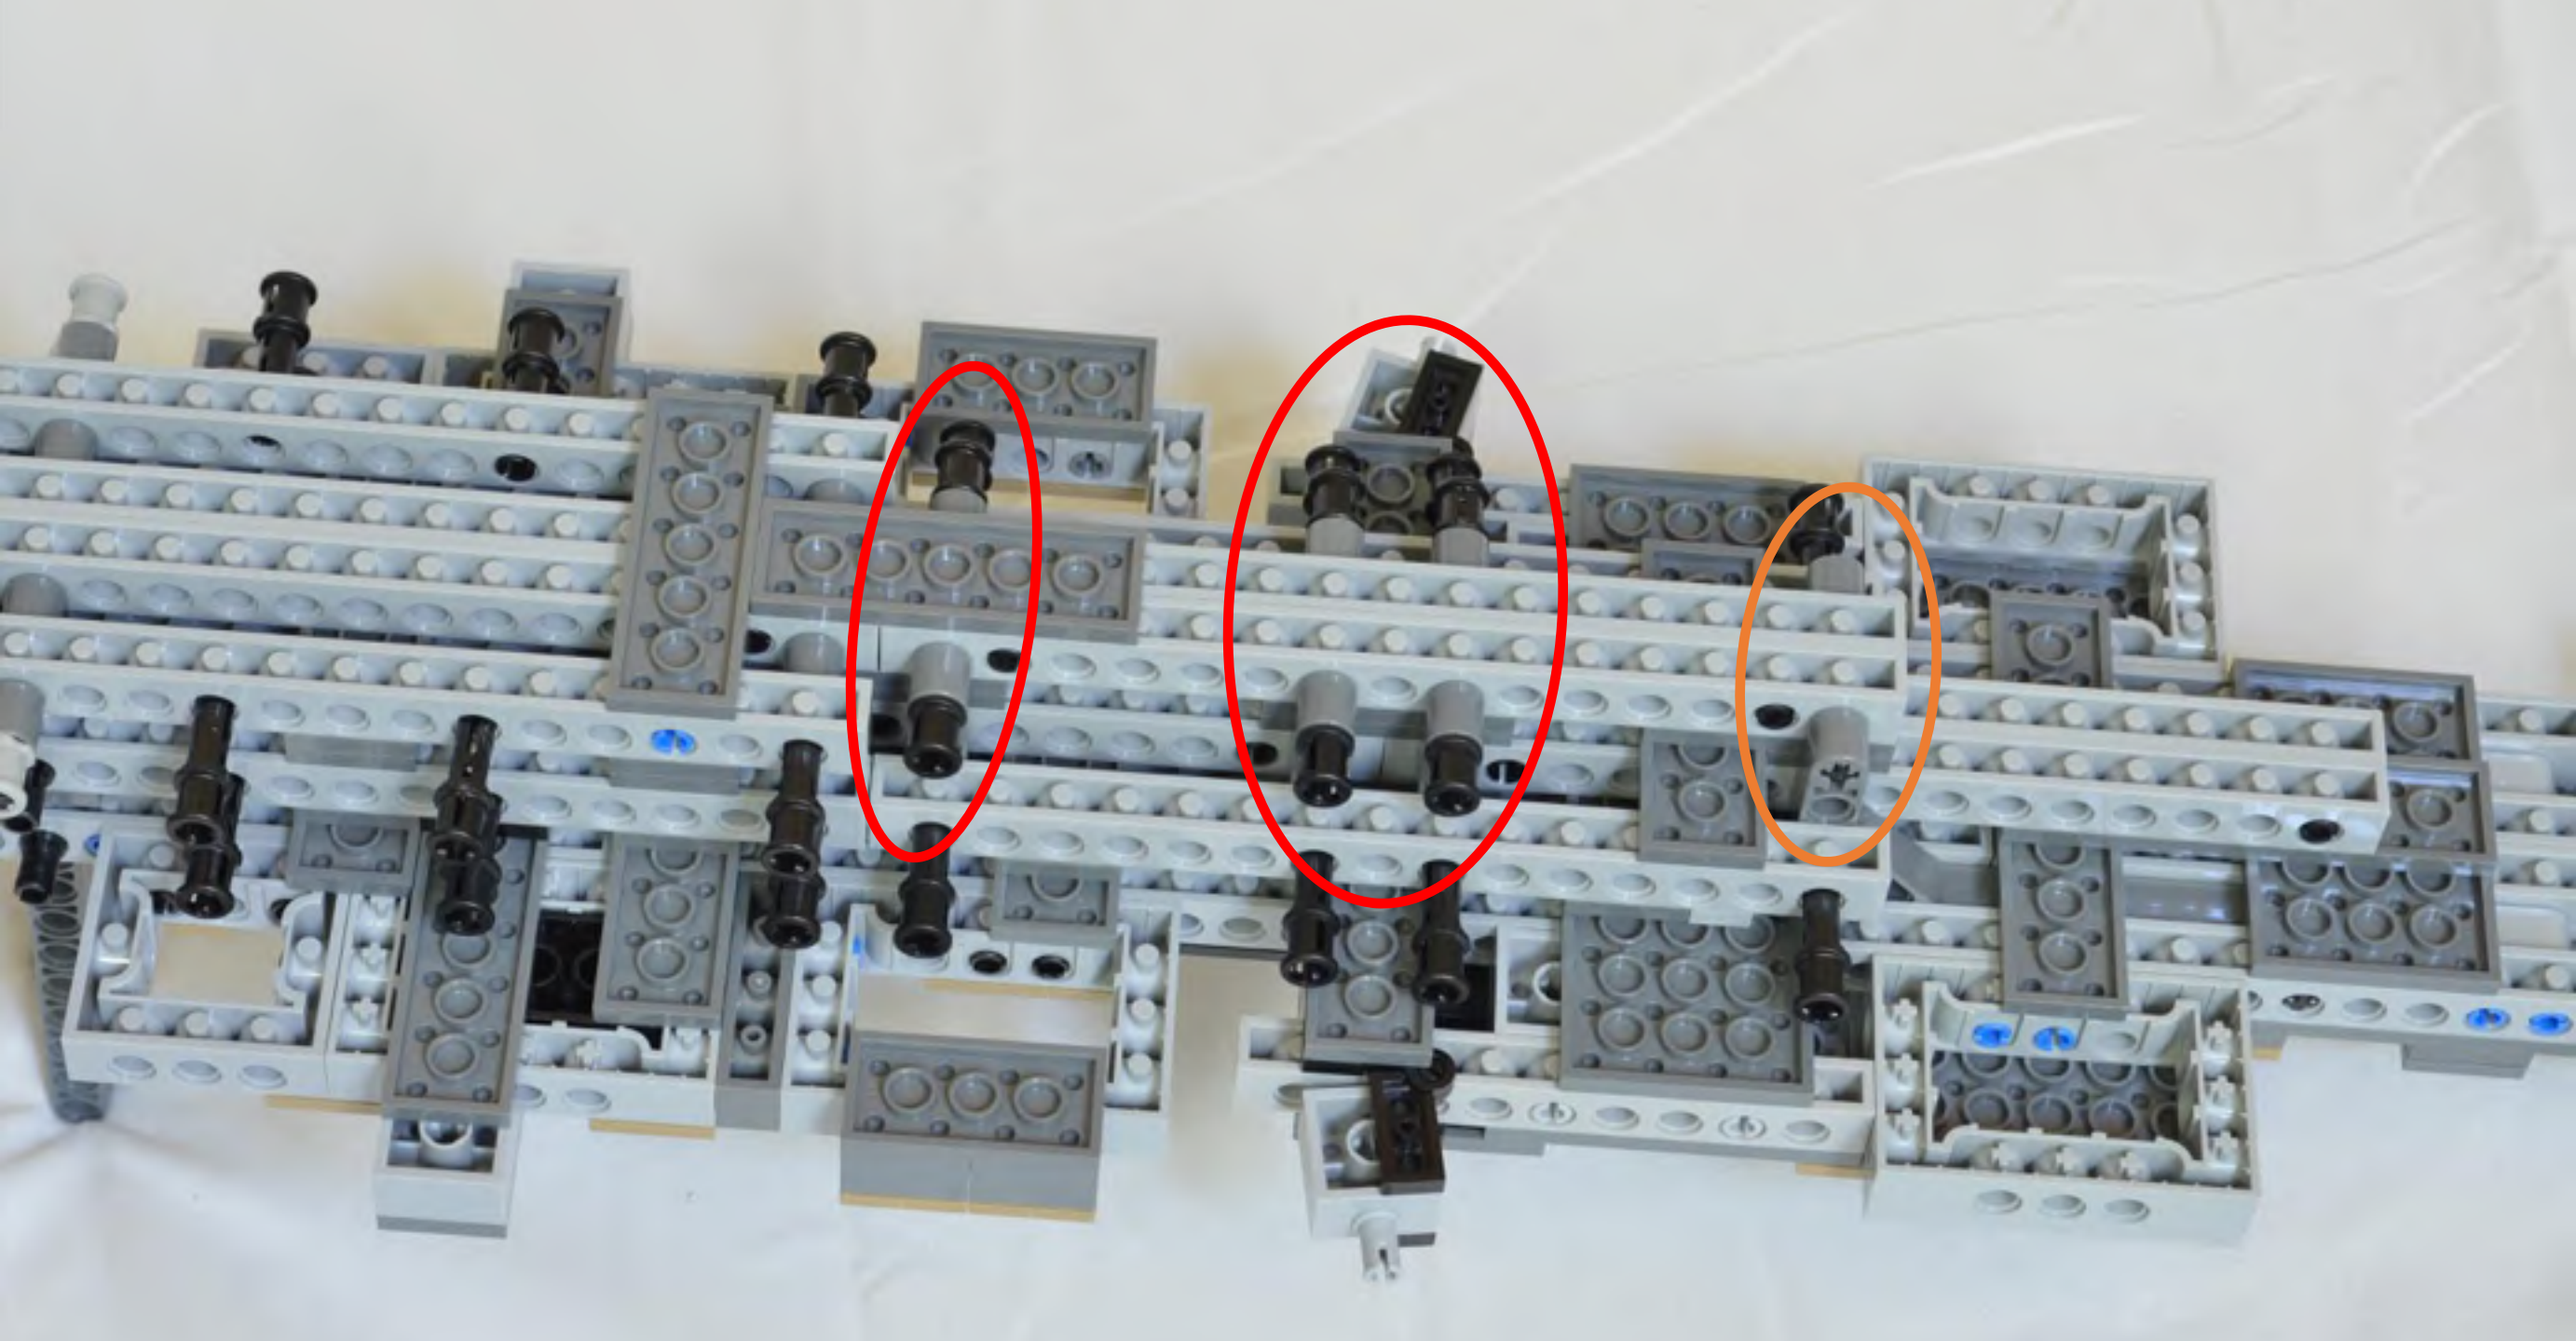




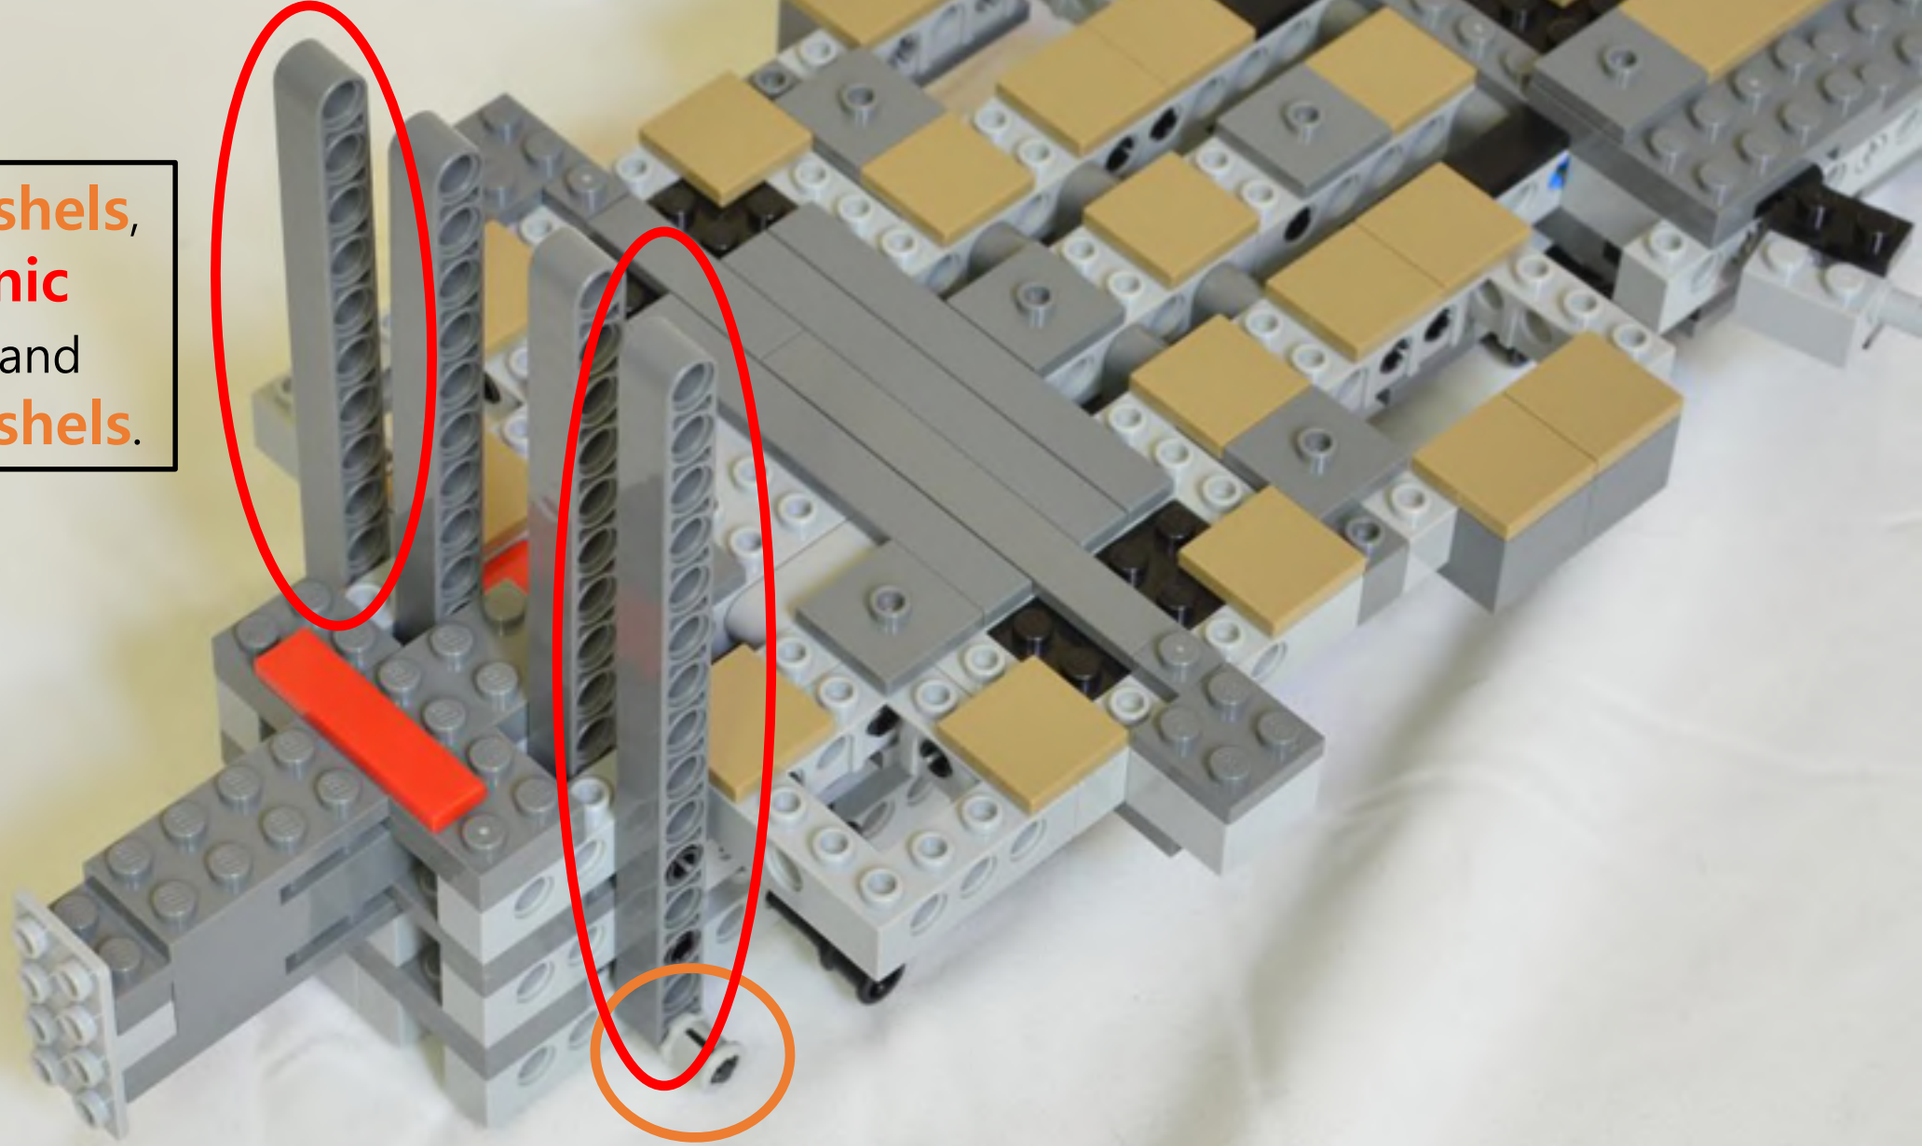
Connect both sections, lining up the backs. The **center technic beams** will slide up through the **back**.

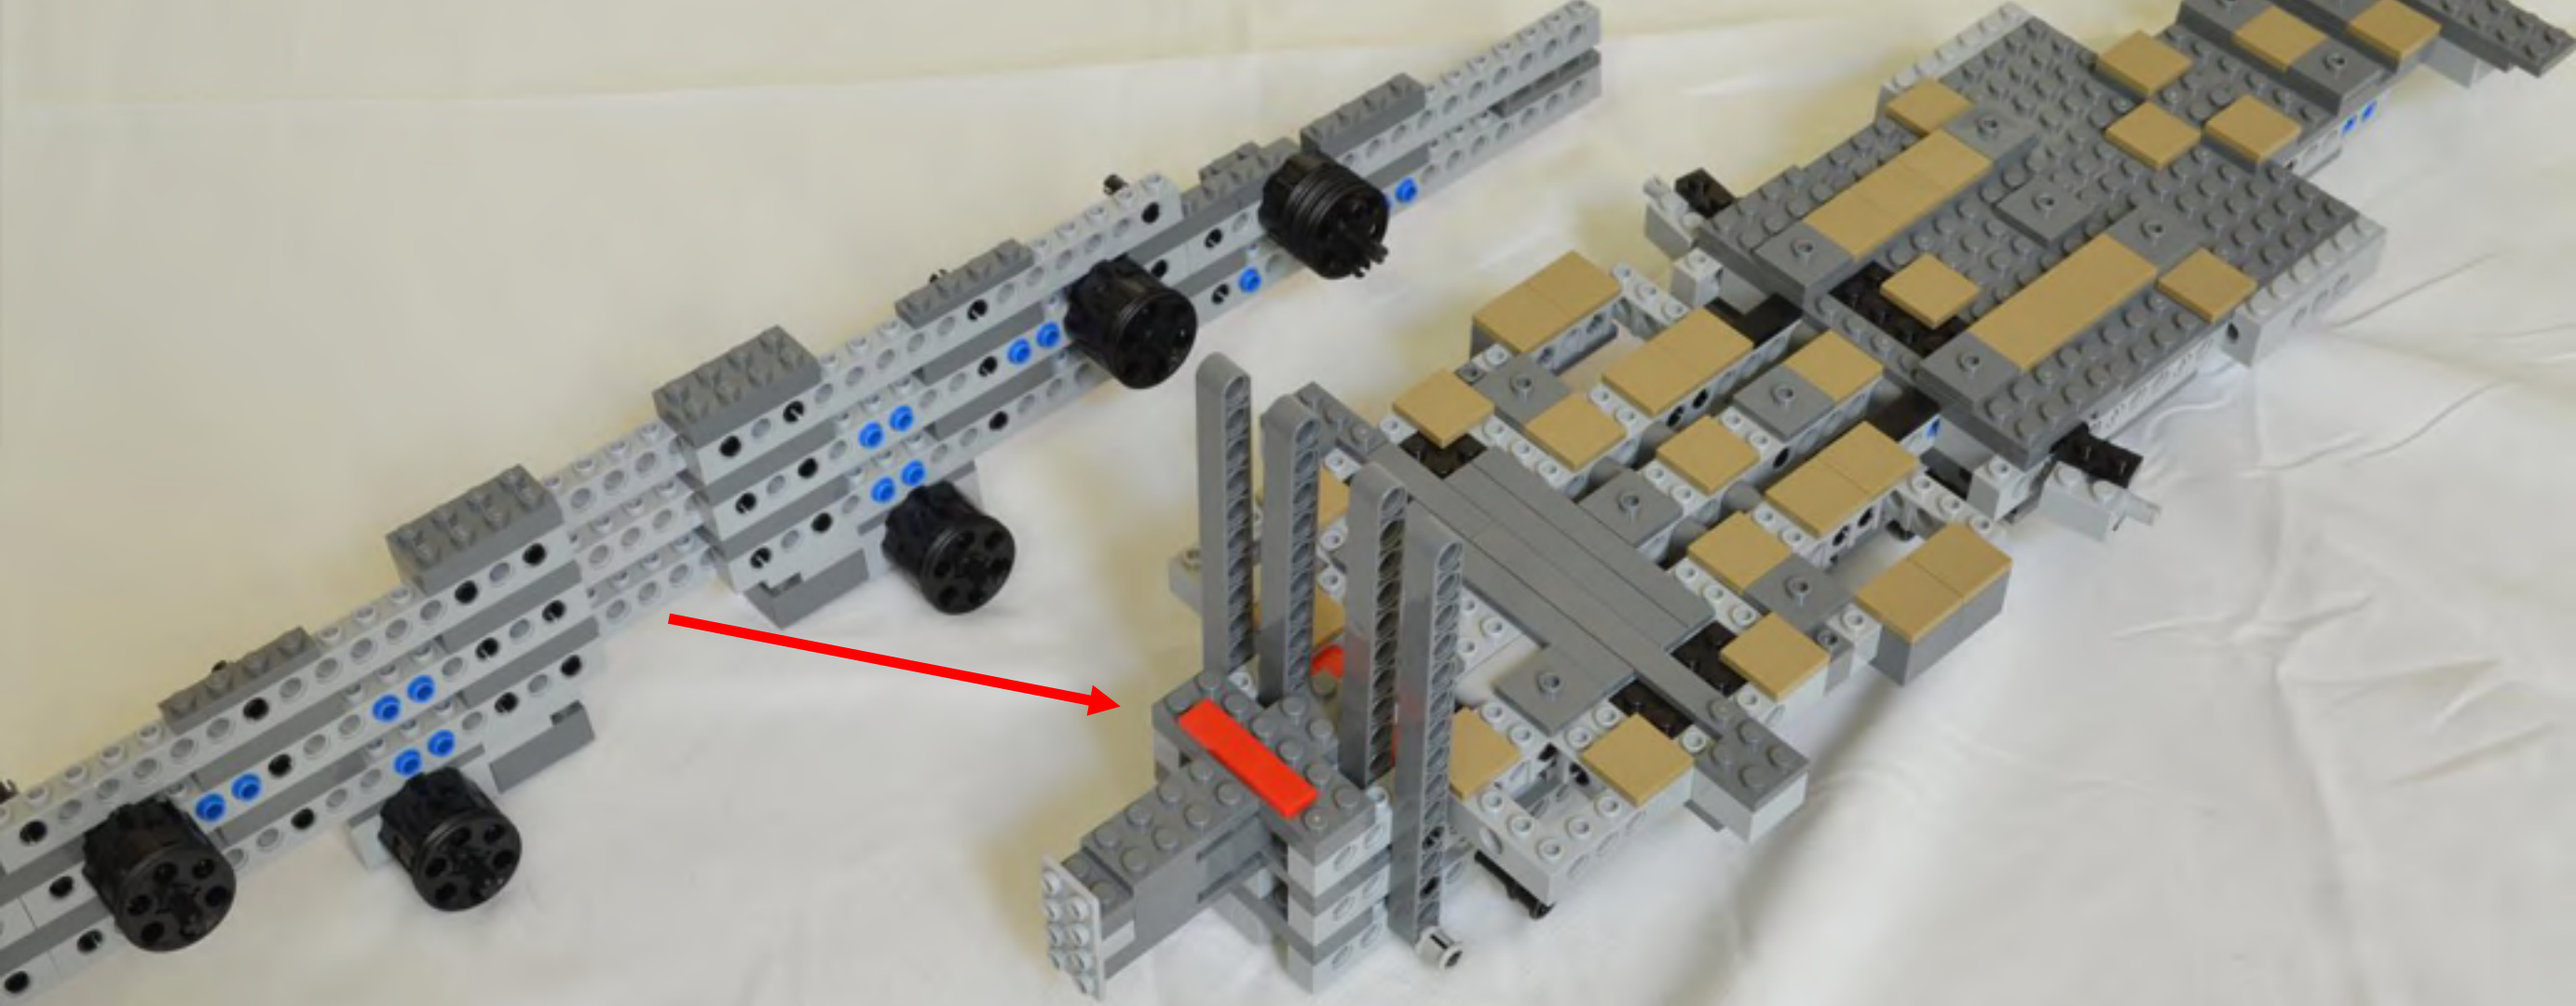


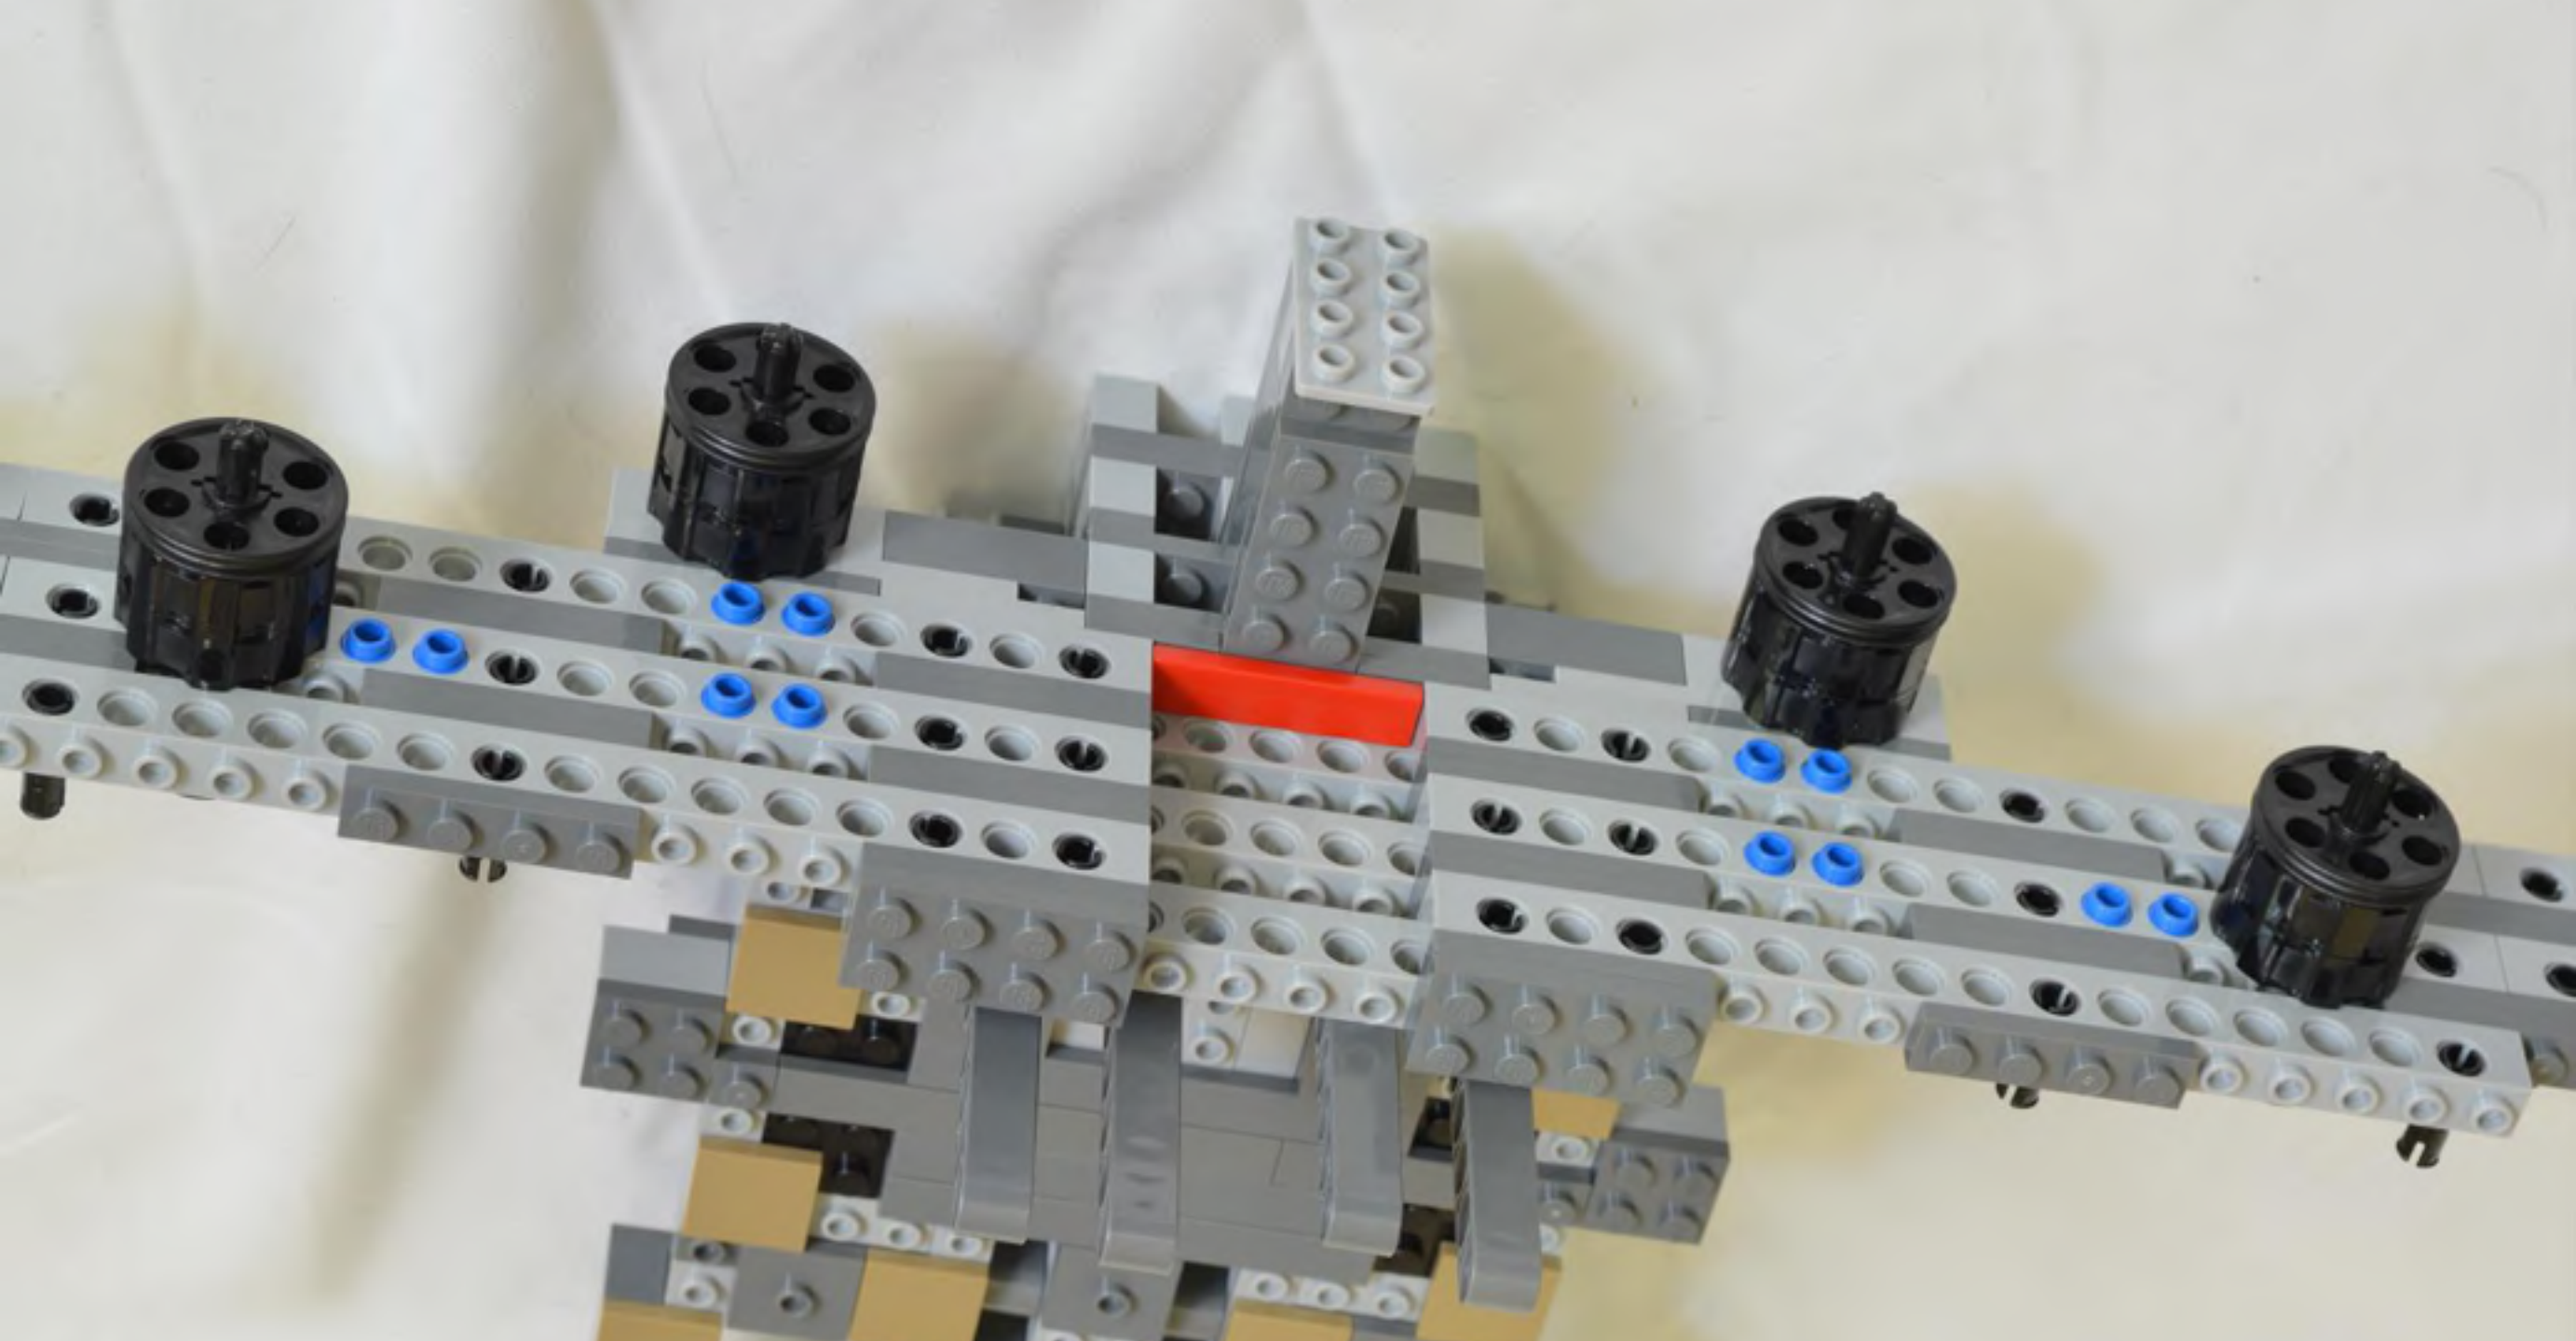
Insert the **technic pins**, three on both sides. Push the **technic axle** through all the way.

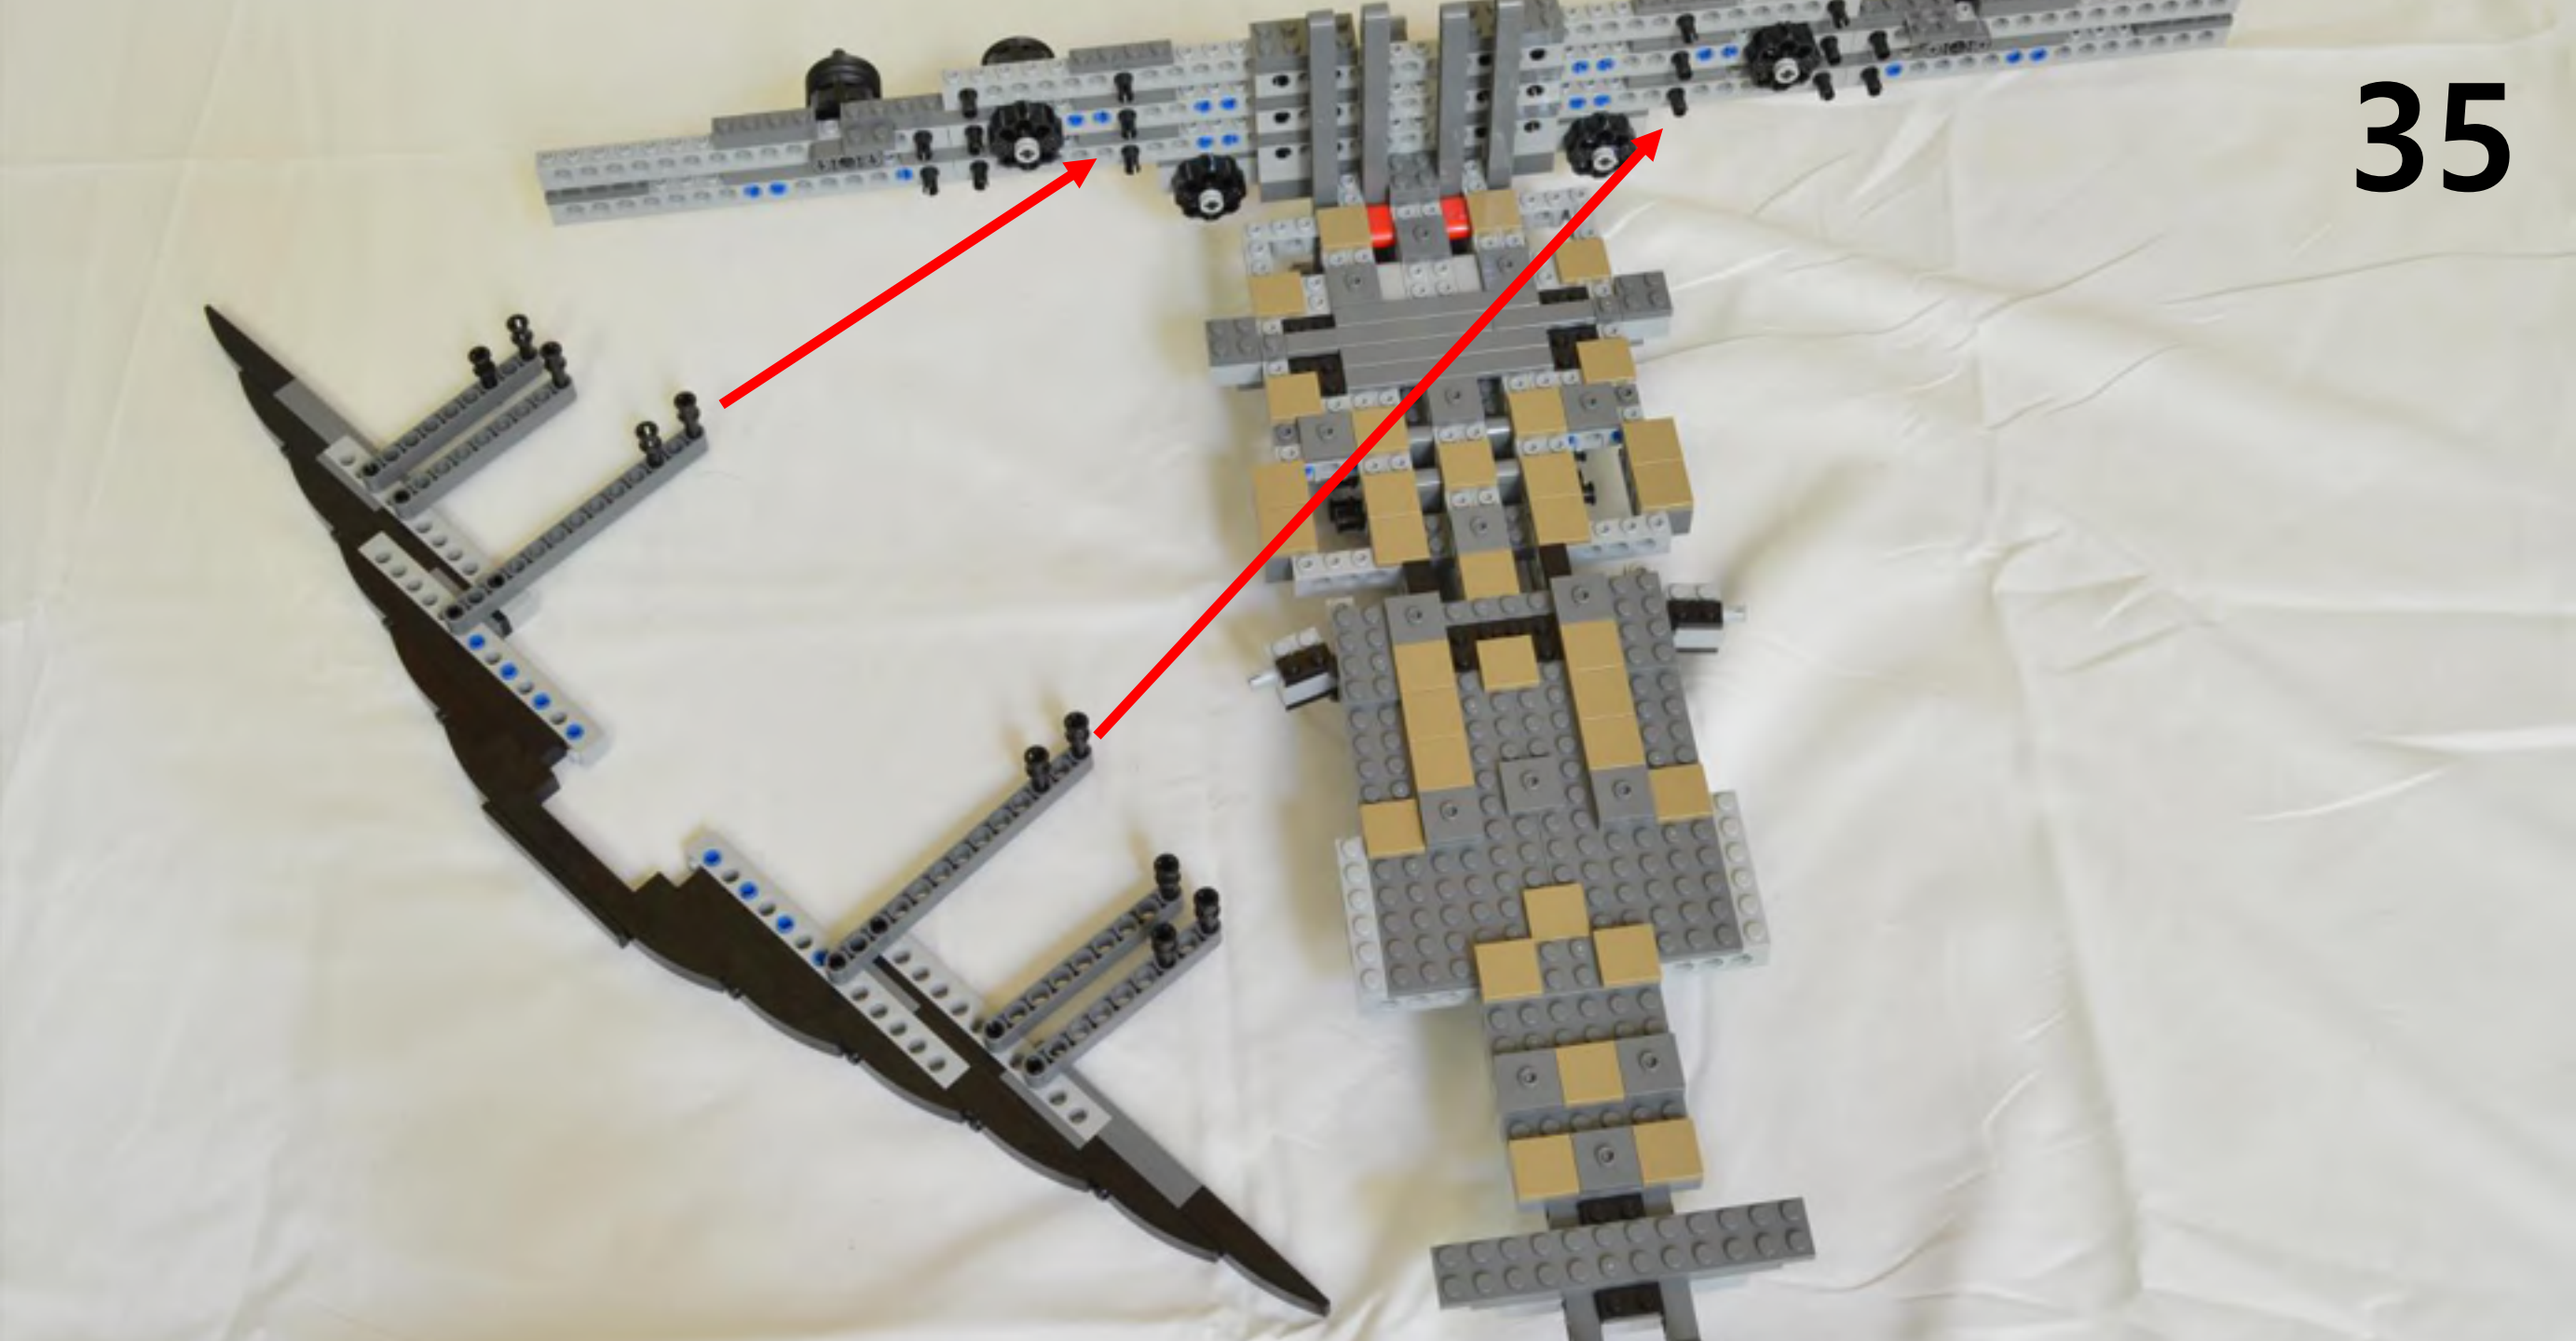


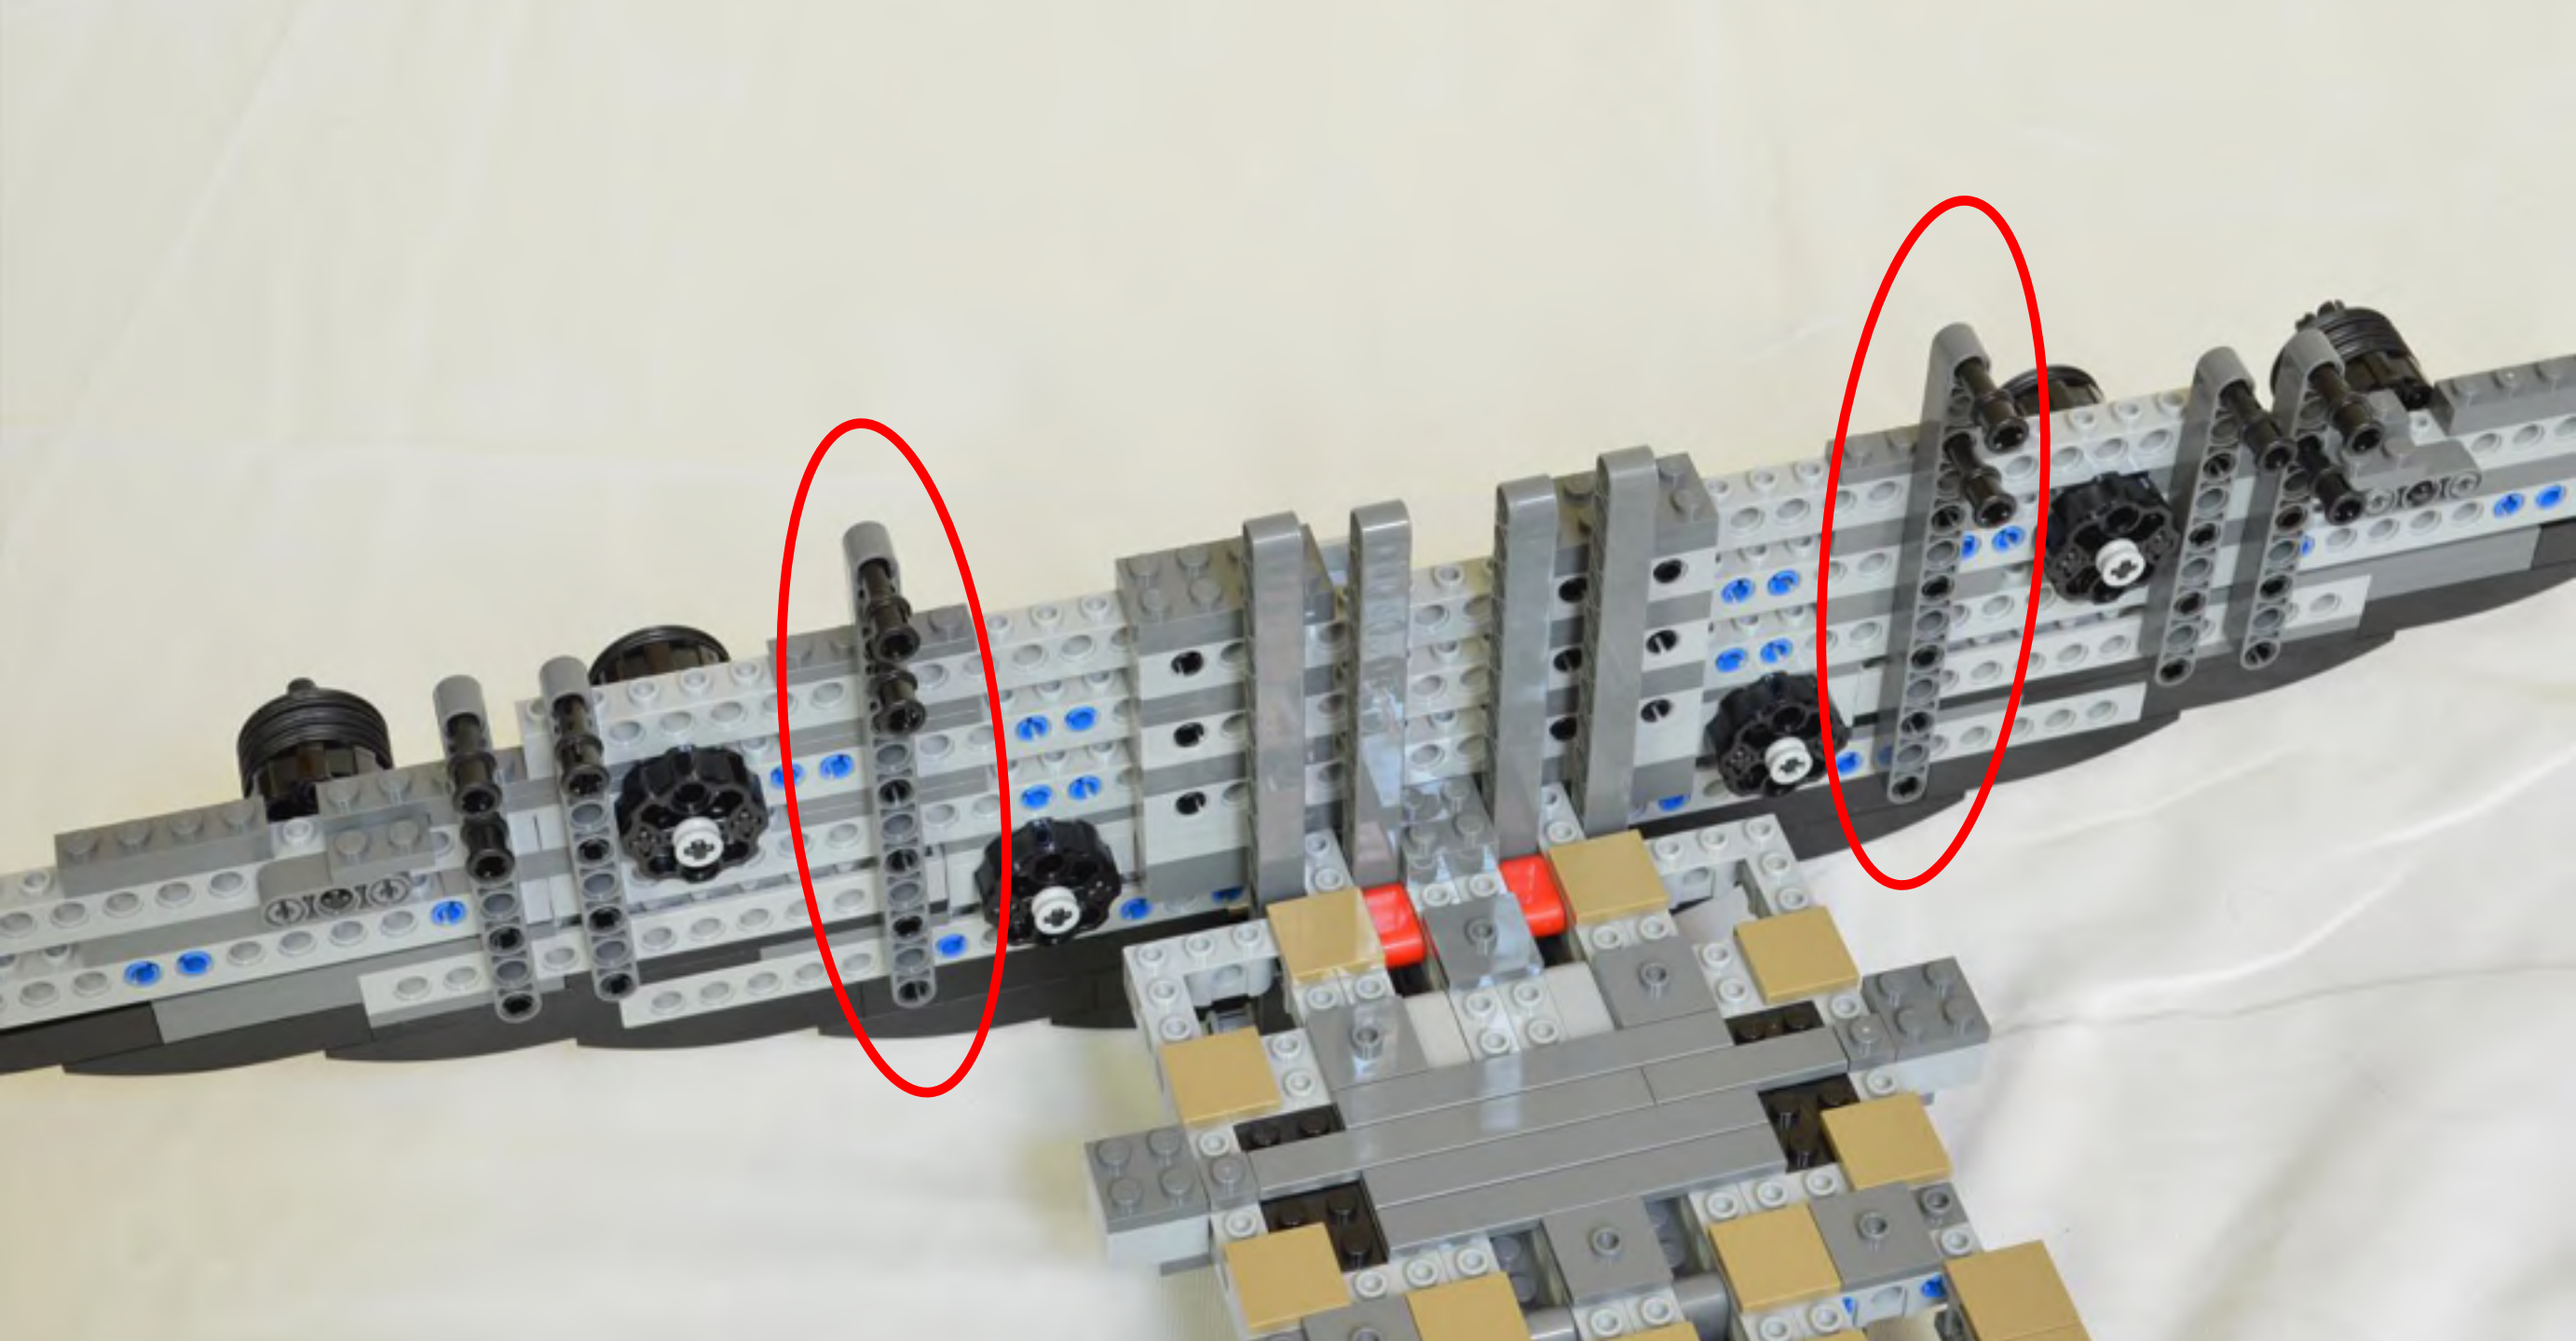
Remove the **technic bushels**, reattach the **outer technic beams** to face upwards, and reattach the **technic bushels**.

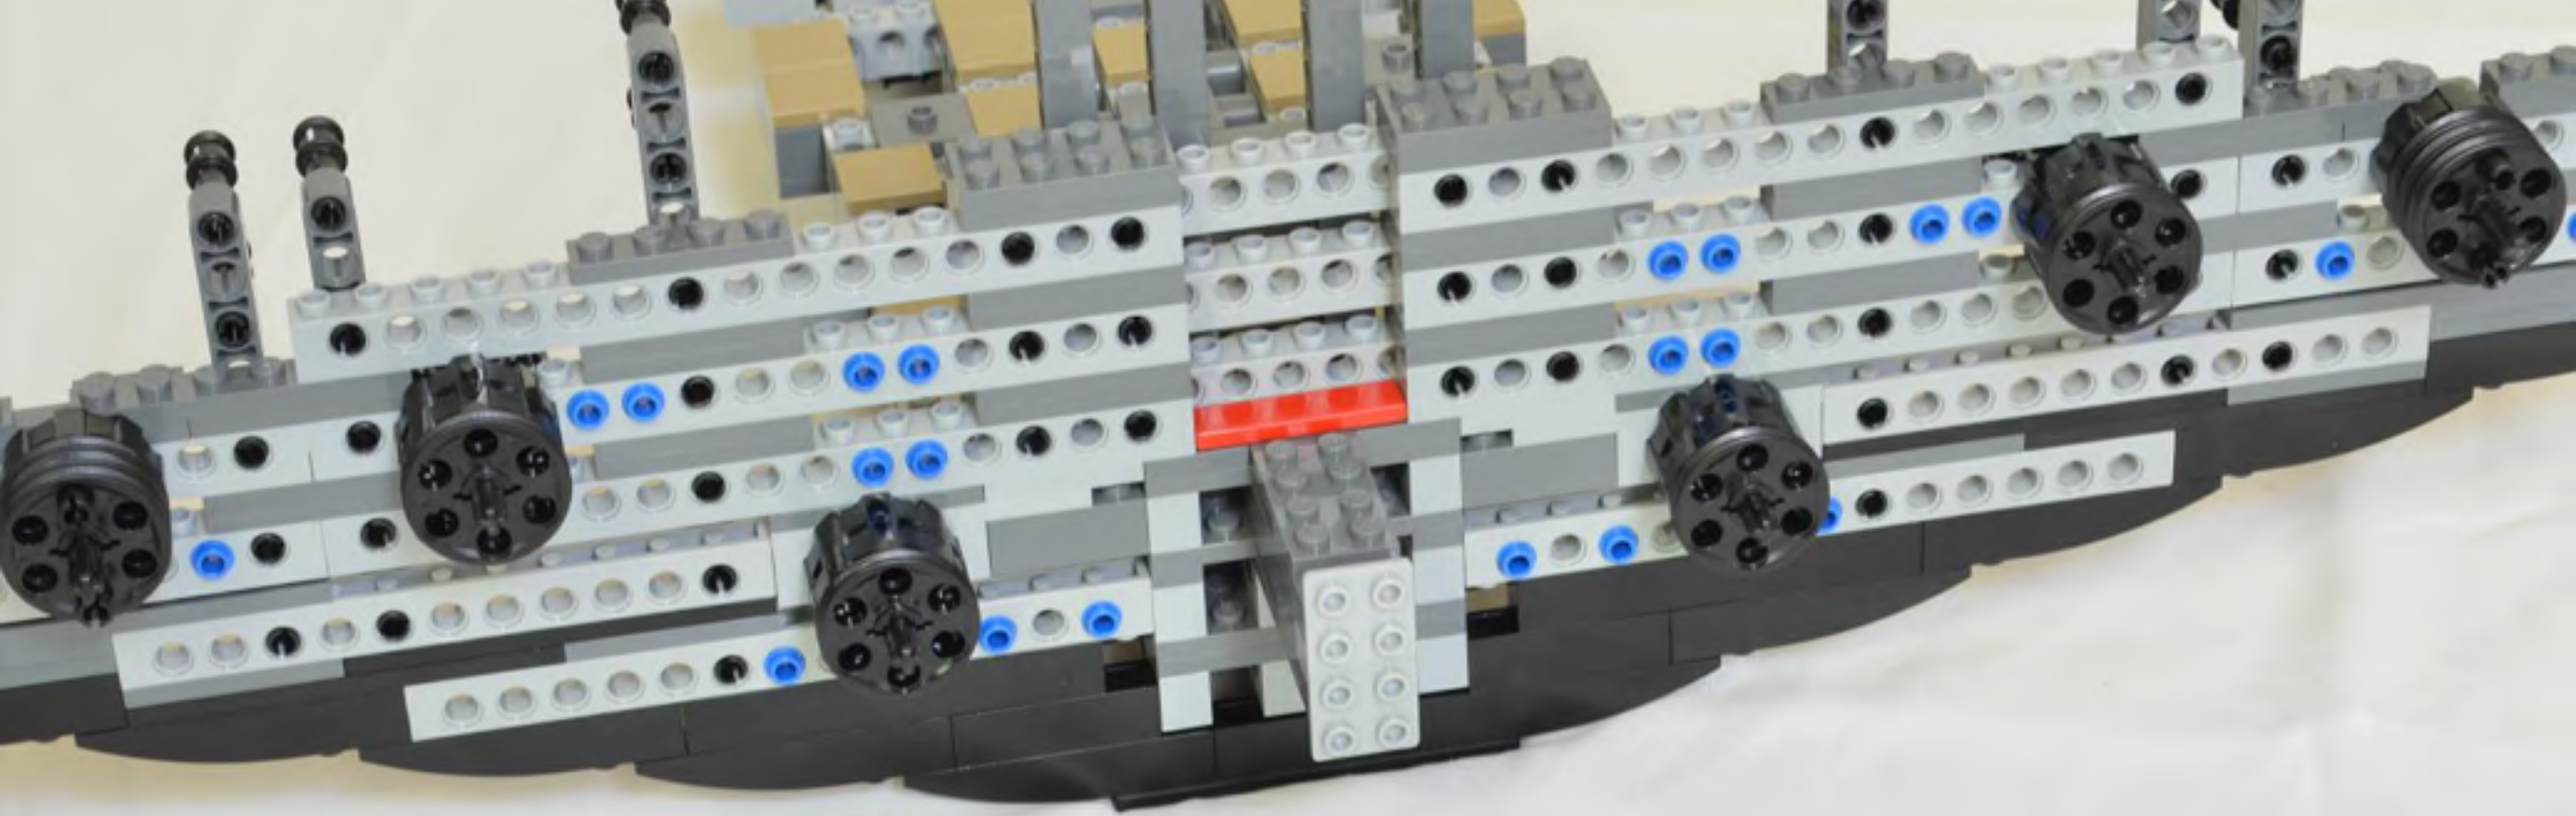




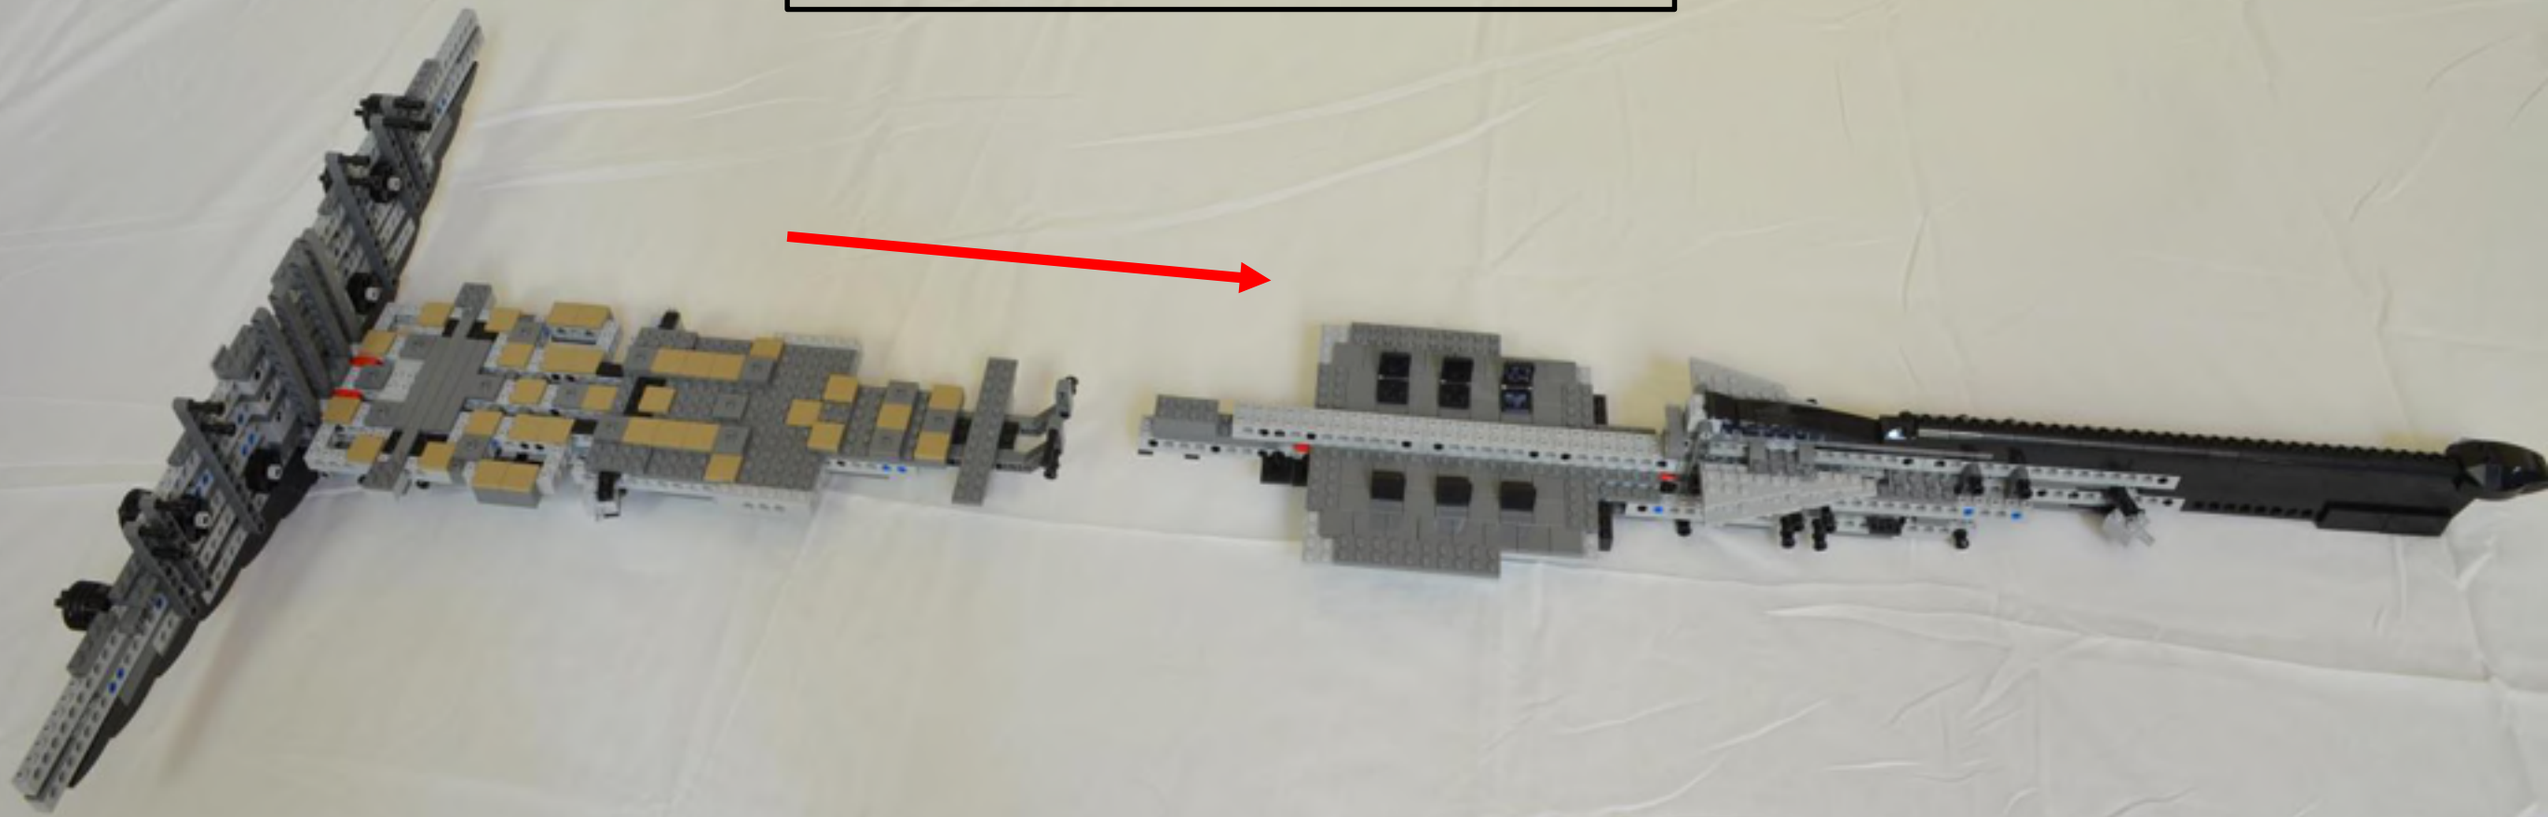




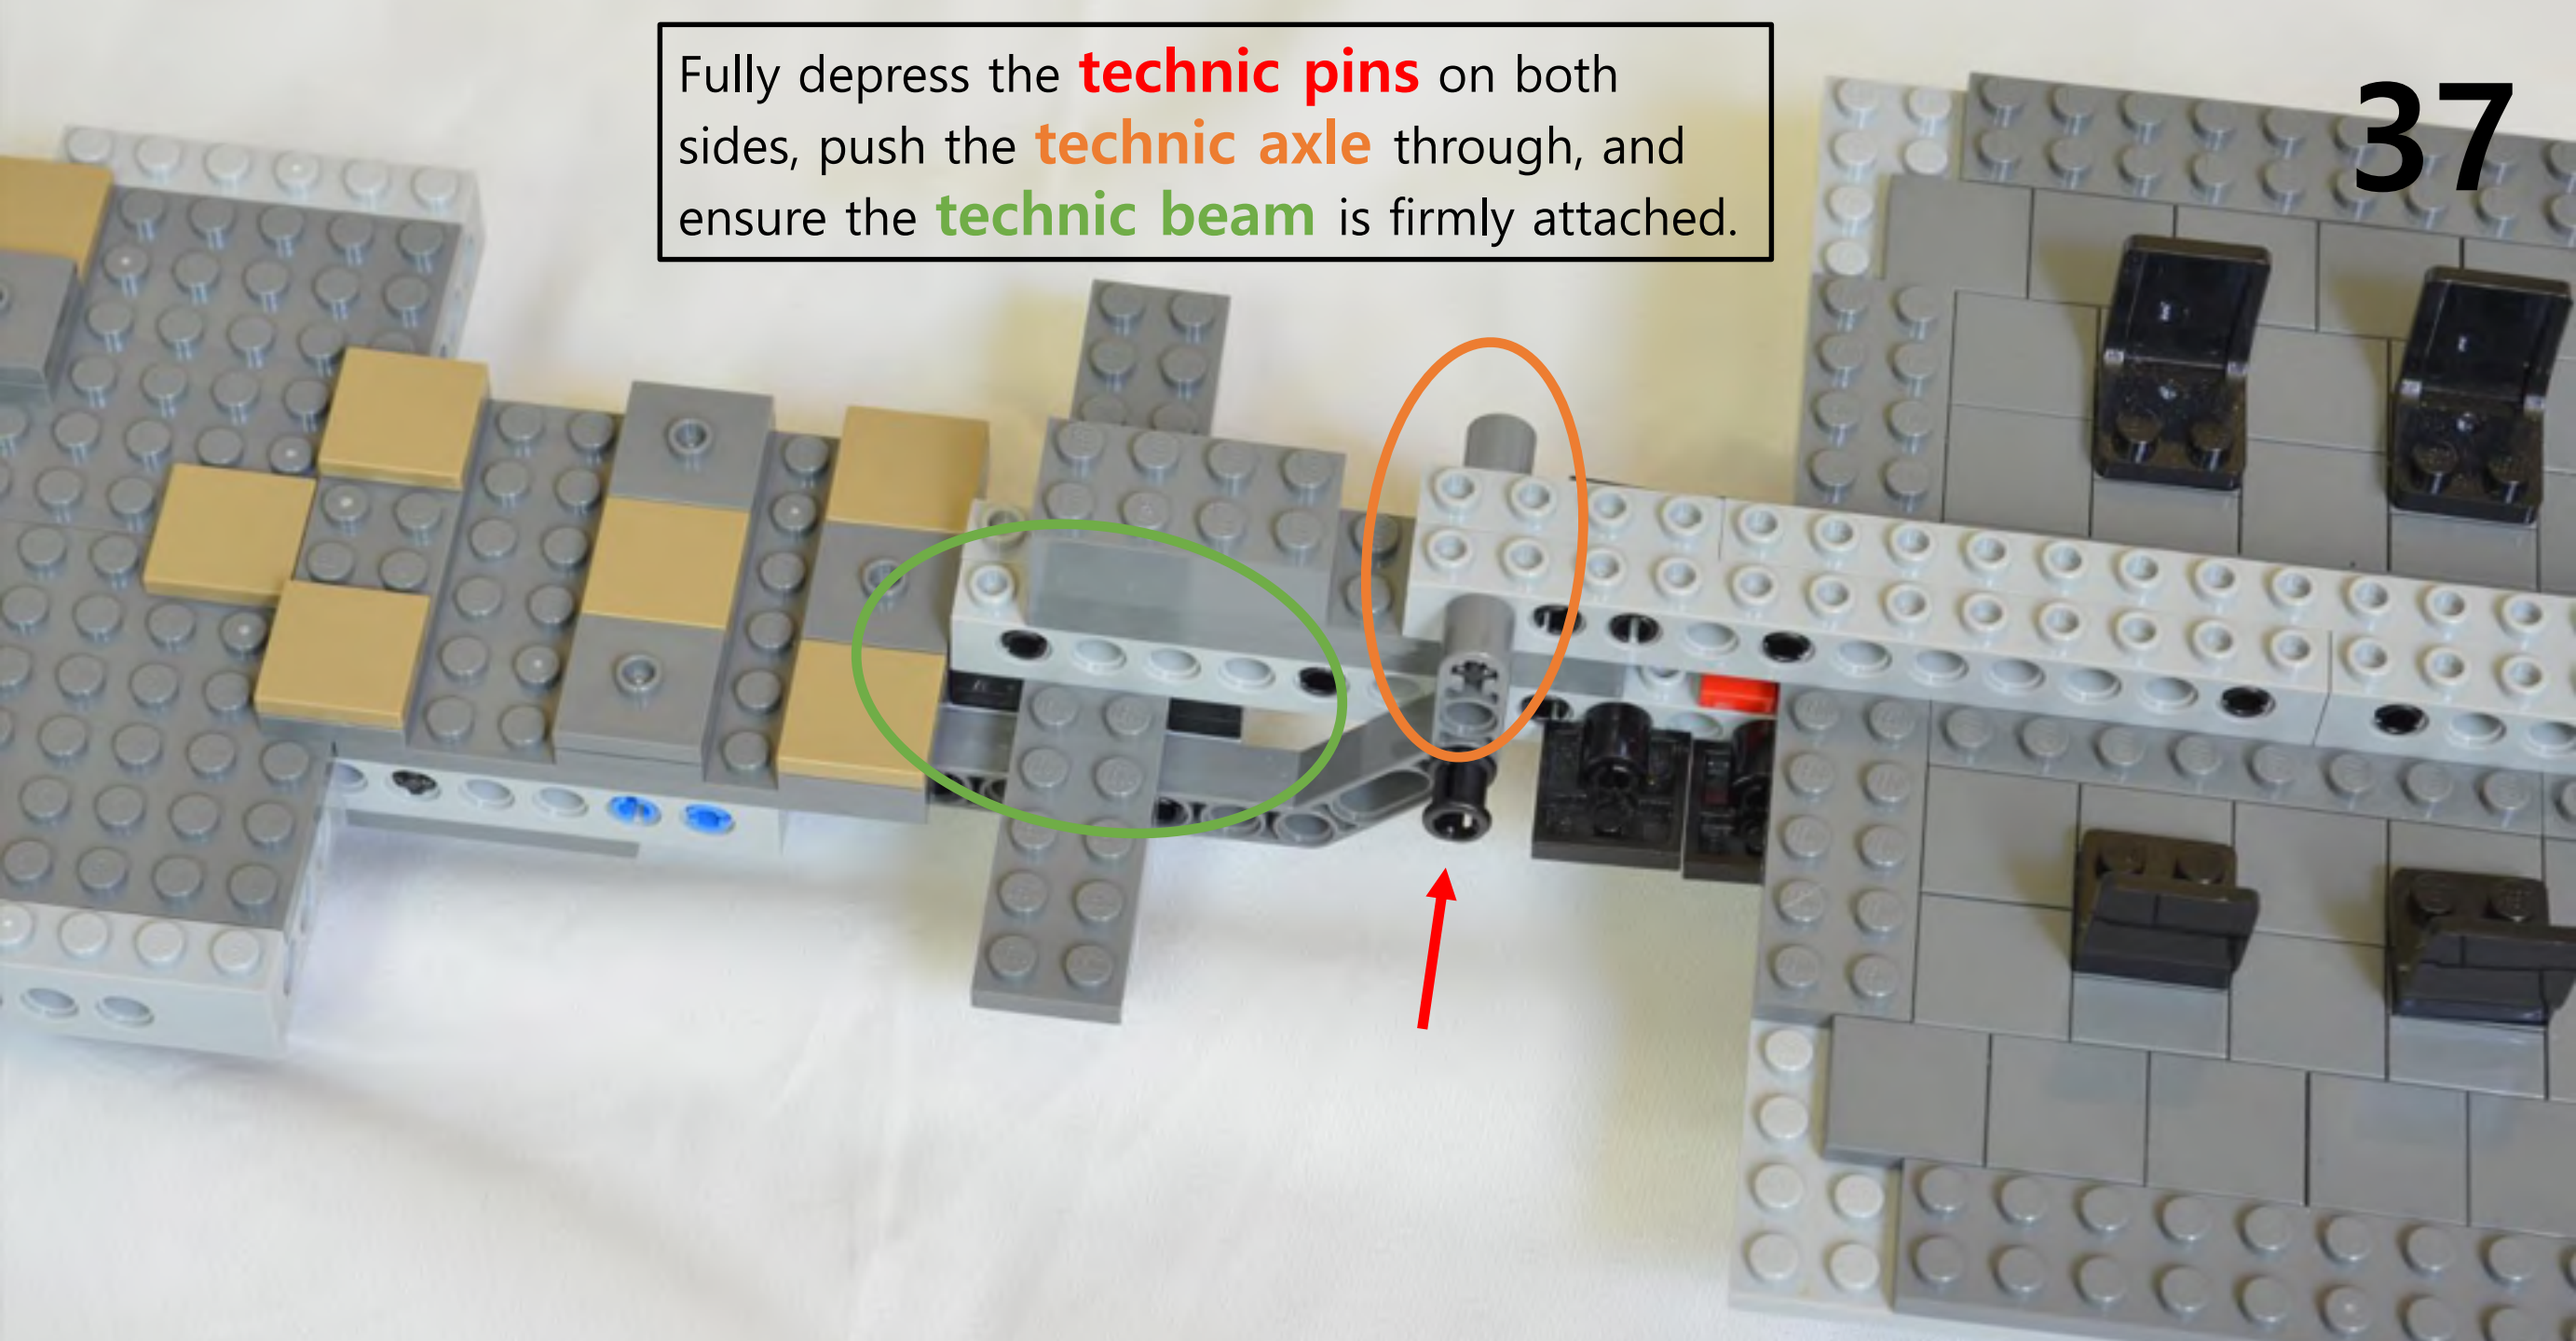


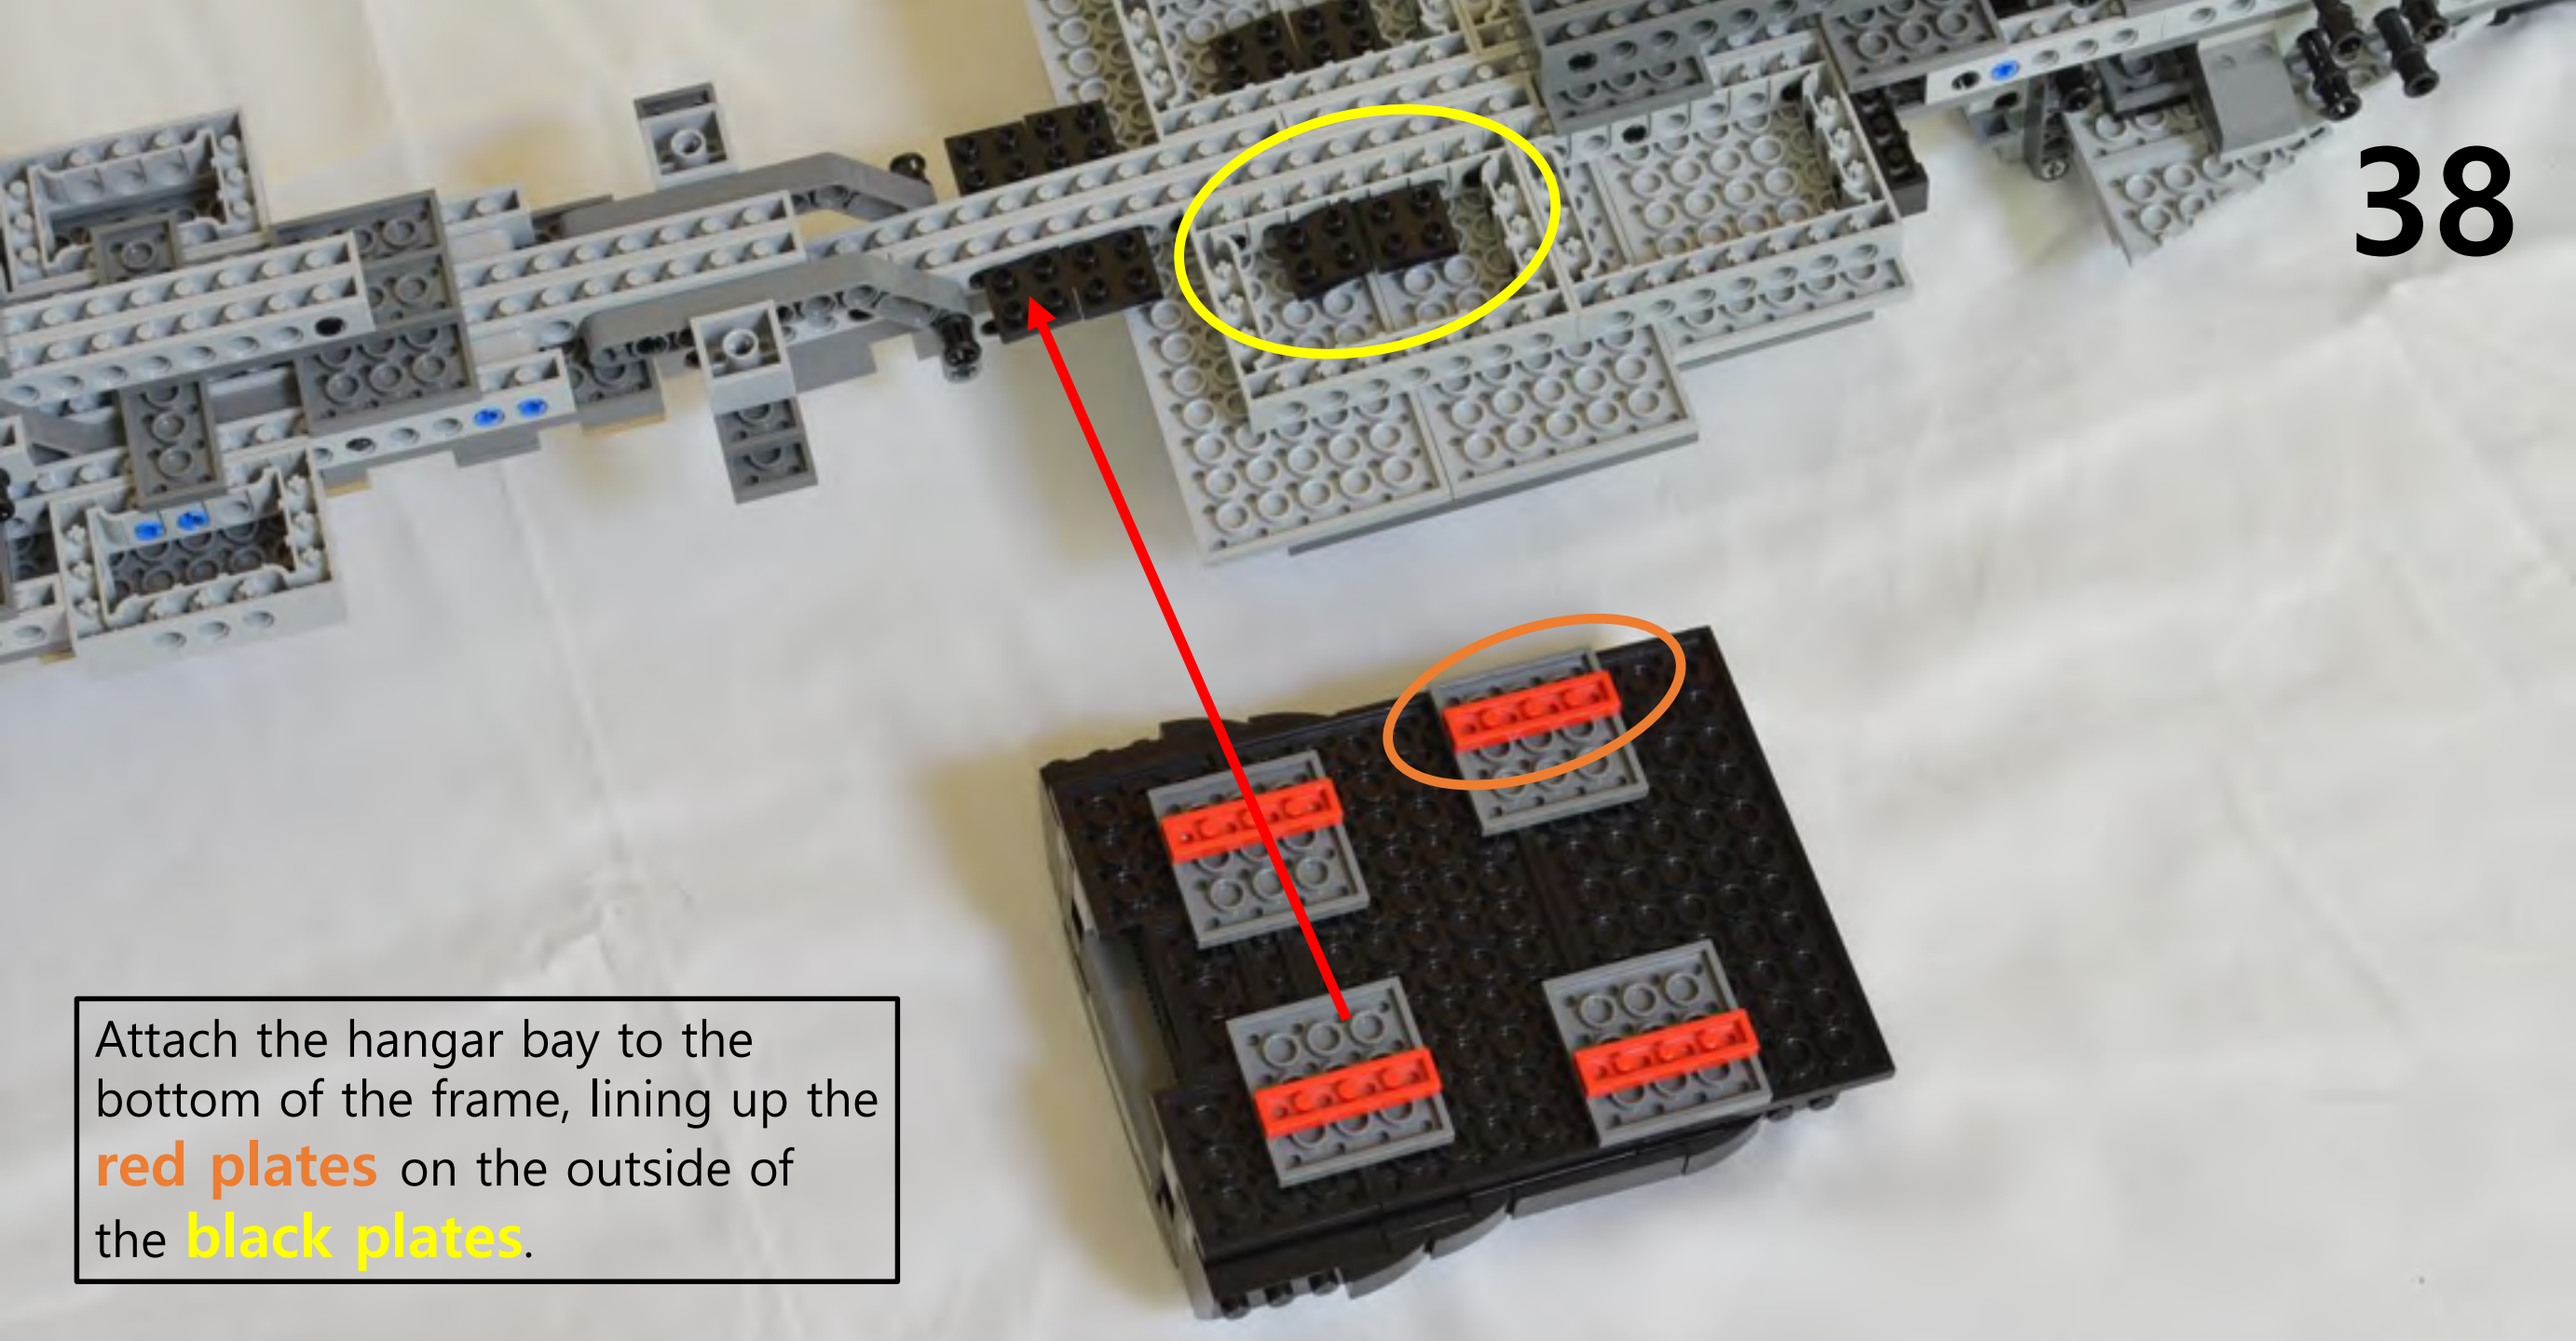


Connect the Rear Inner Frame to the Front Inner Frame.

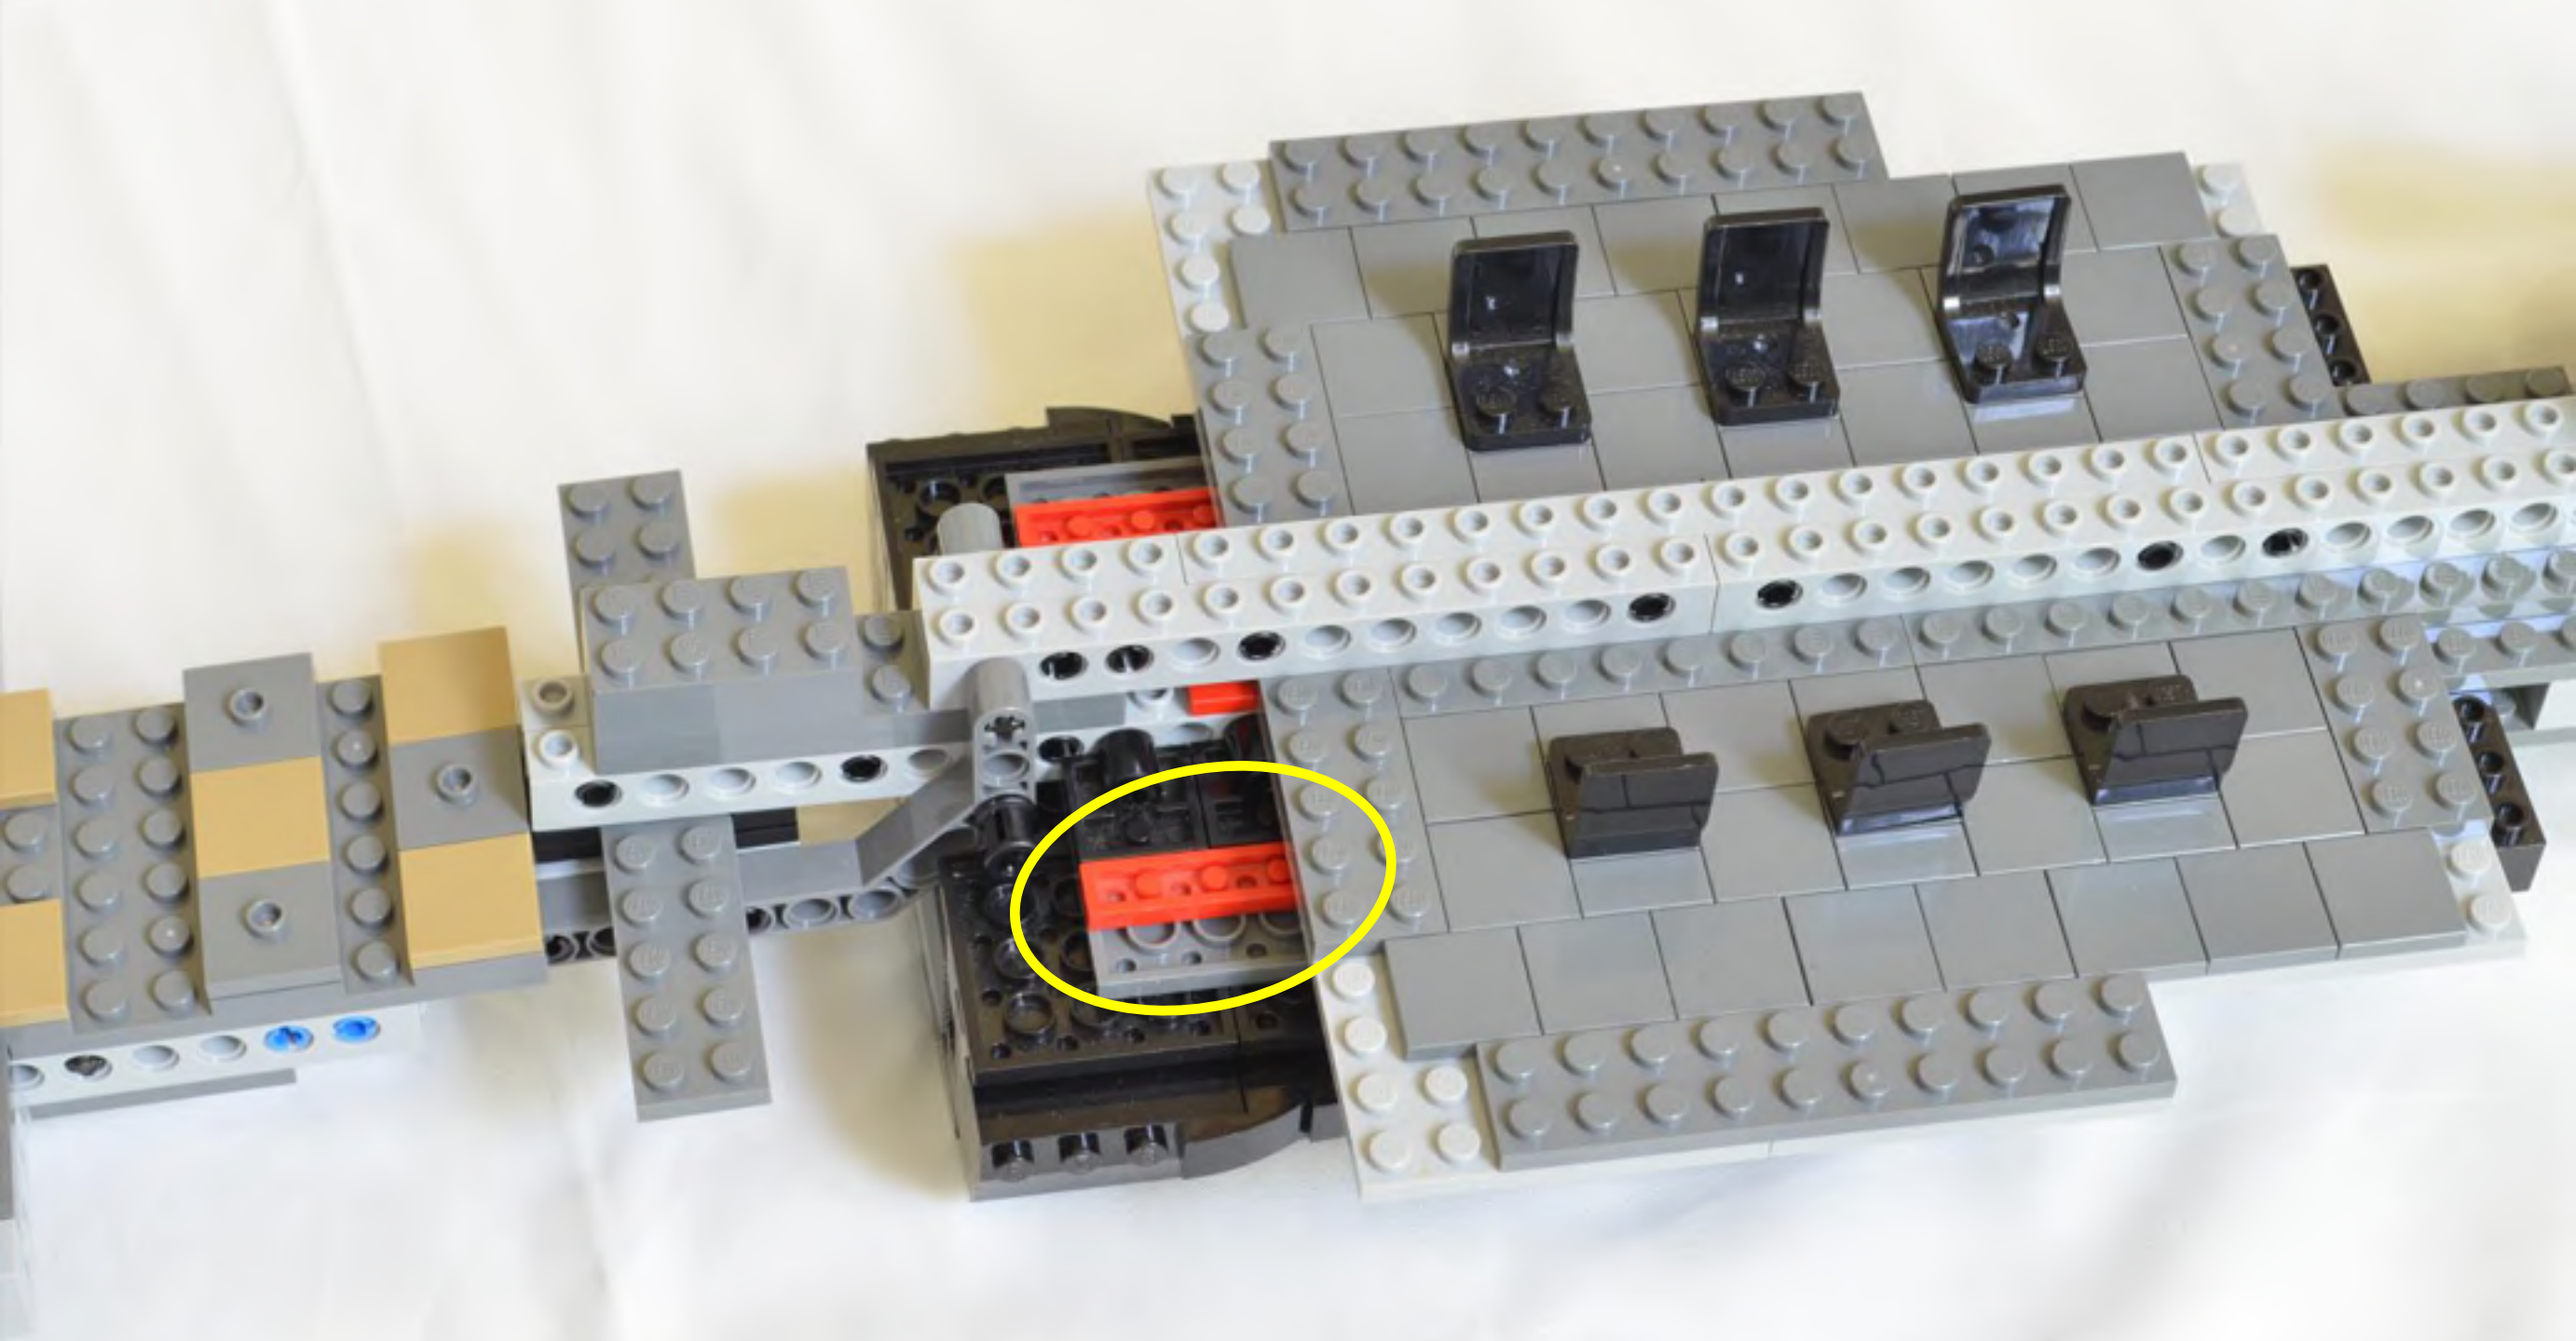


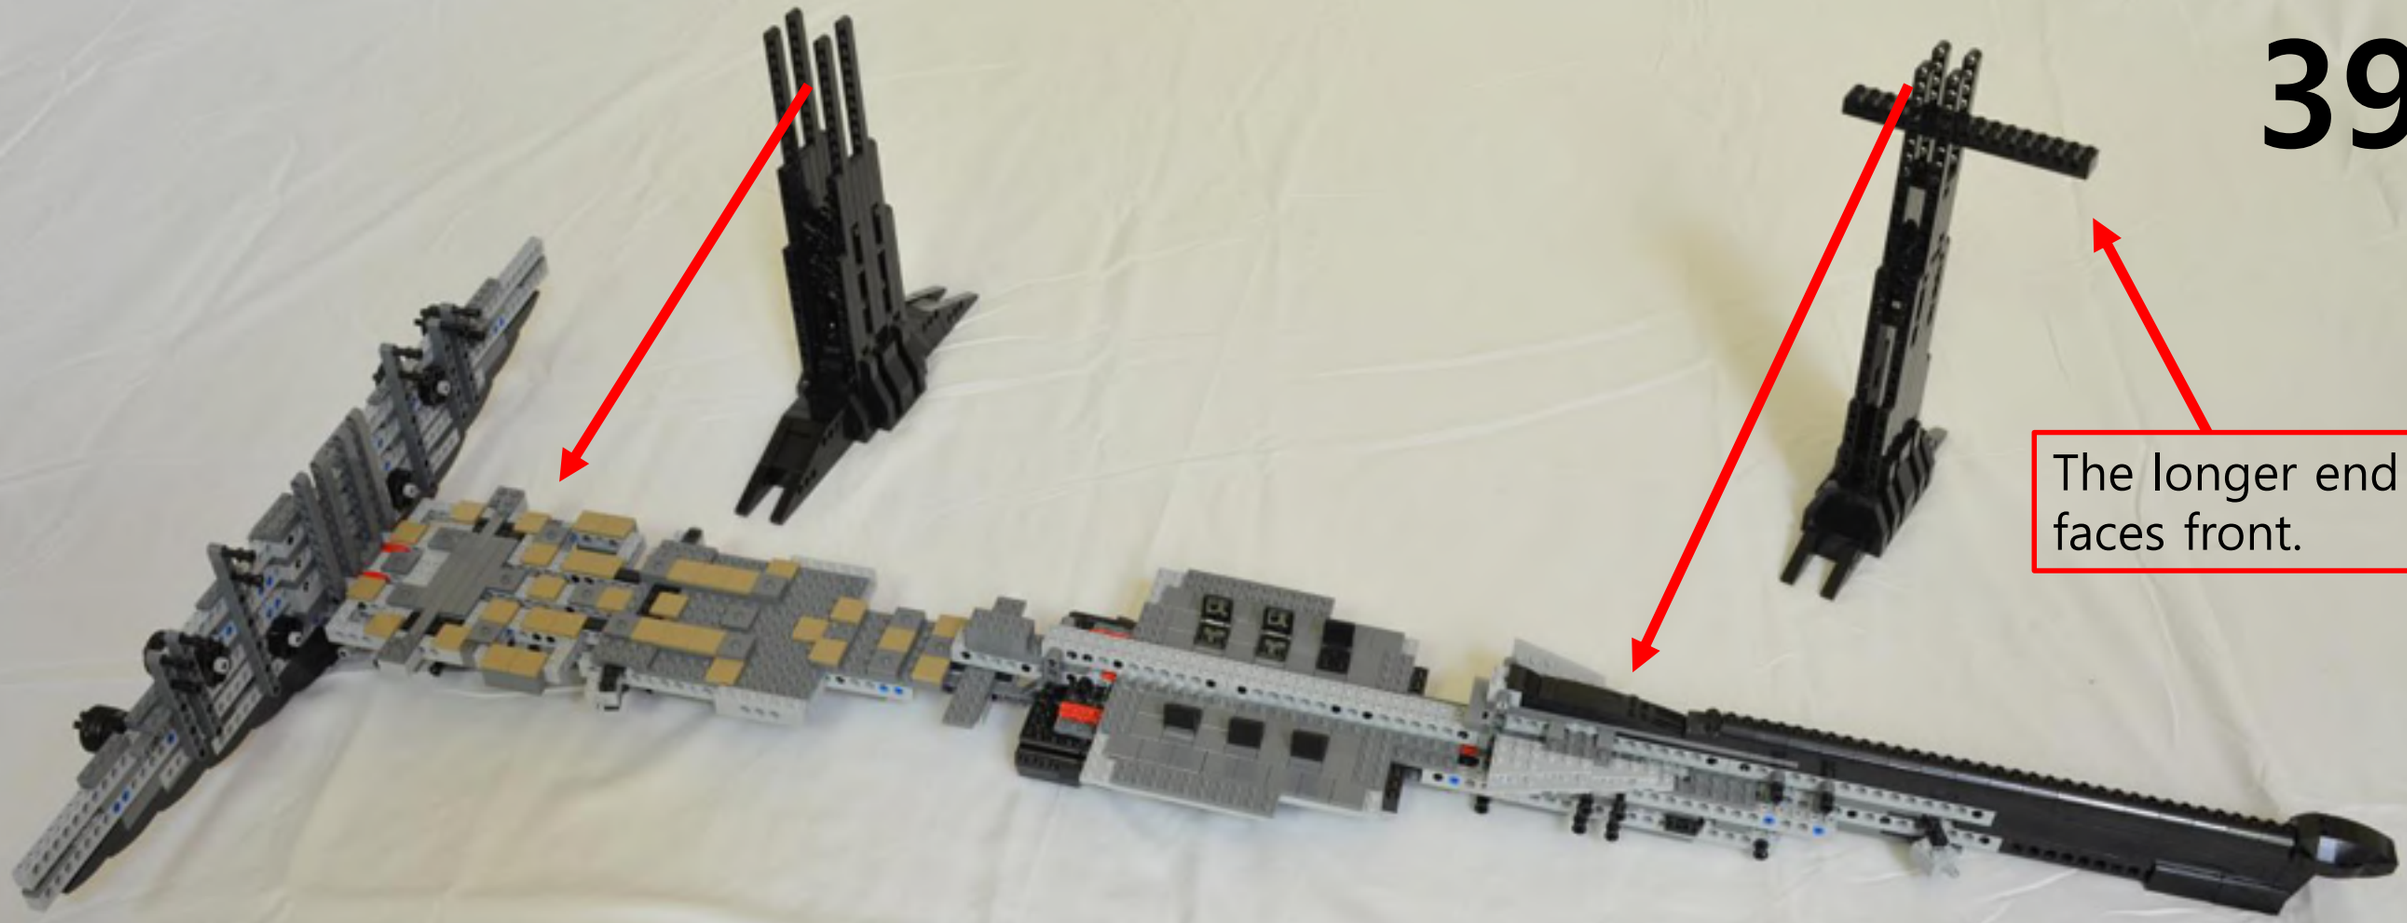
Fully depress the **technic pins** on both sides, push the **technic axle** through, and ensure the **technic beam** is firmly attached.



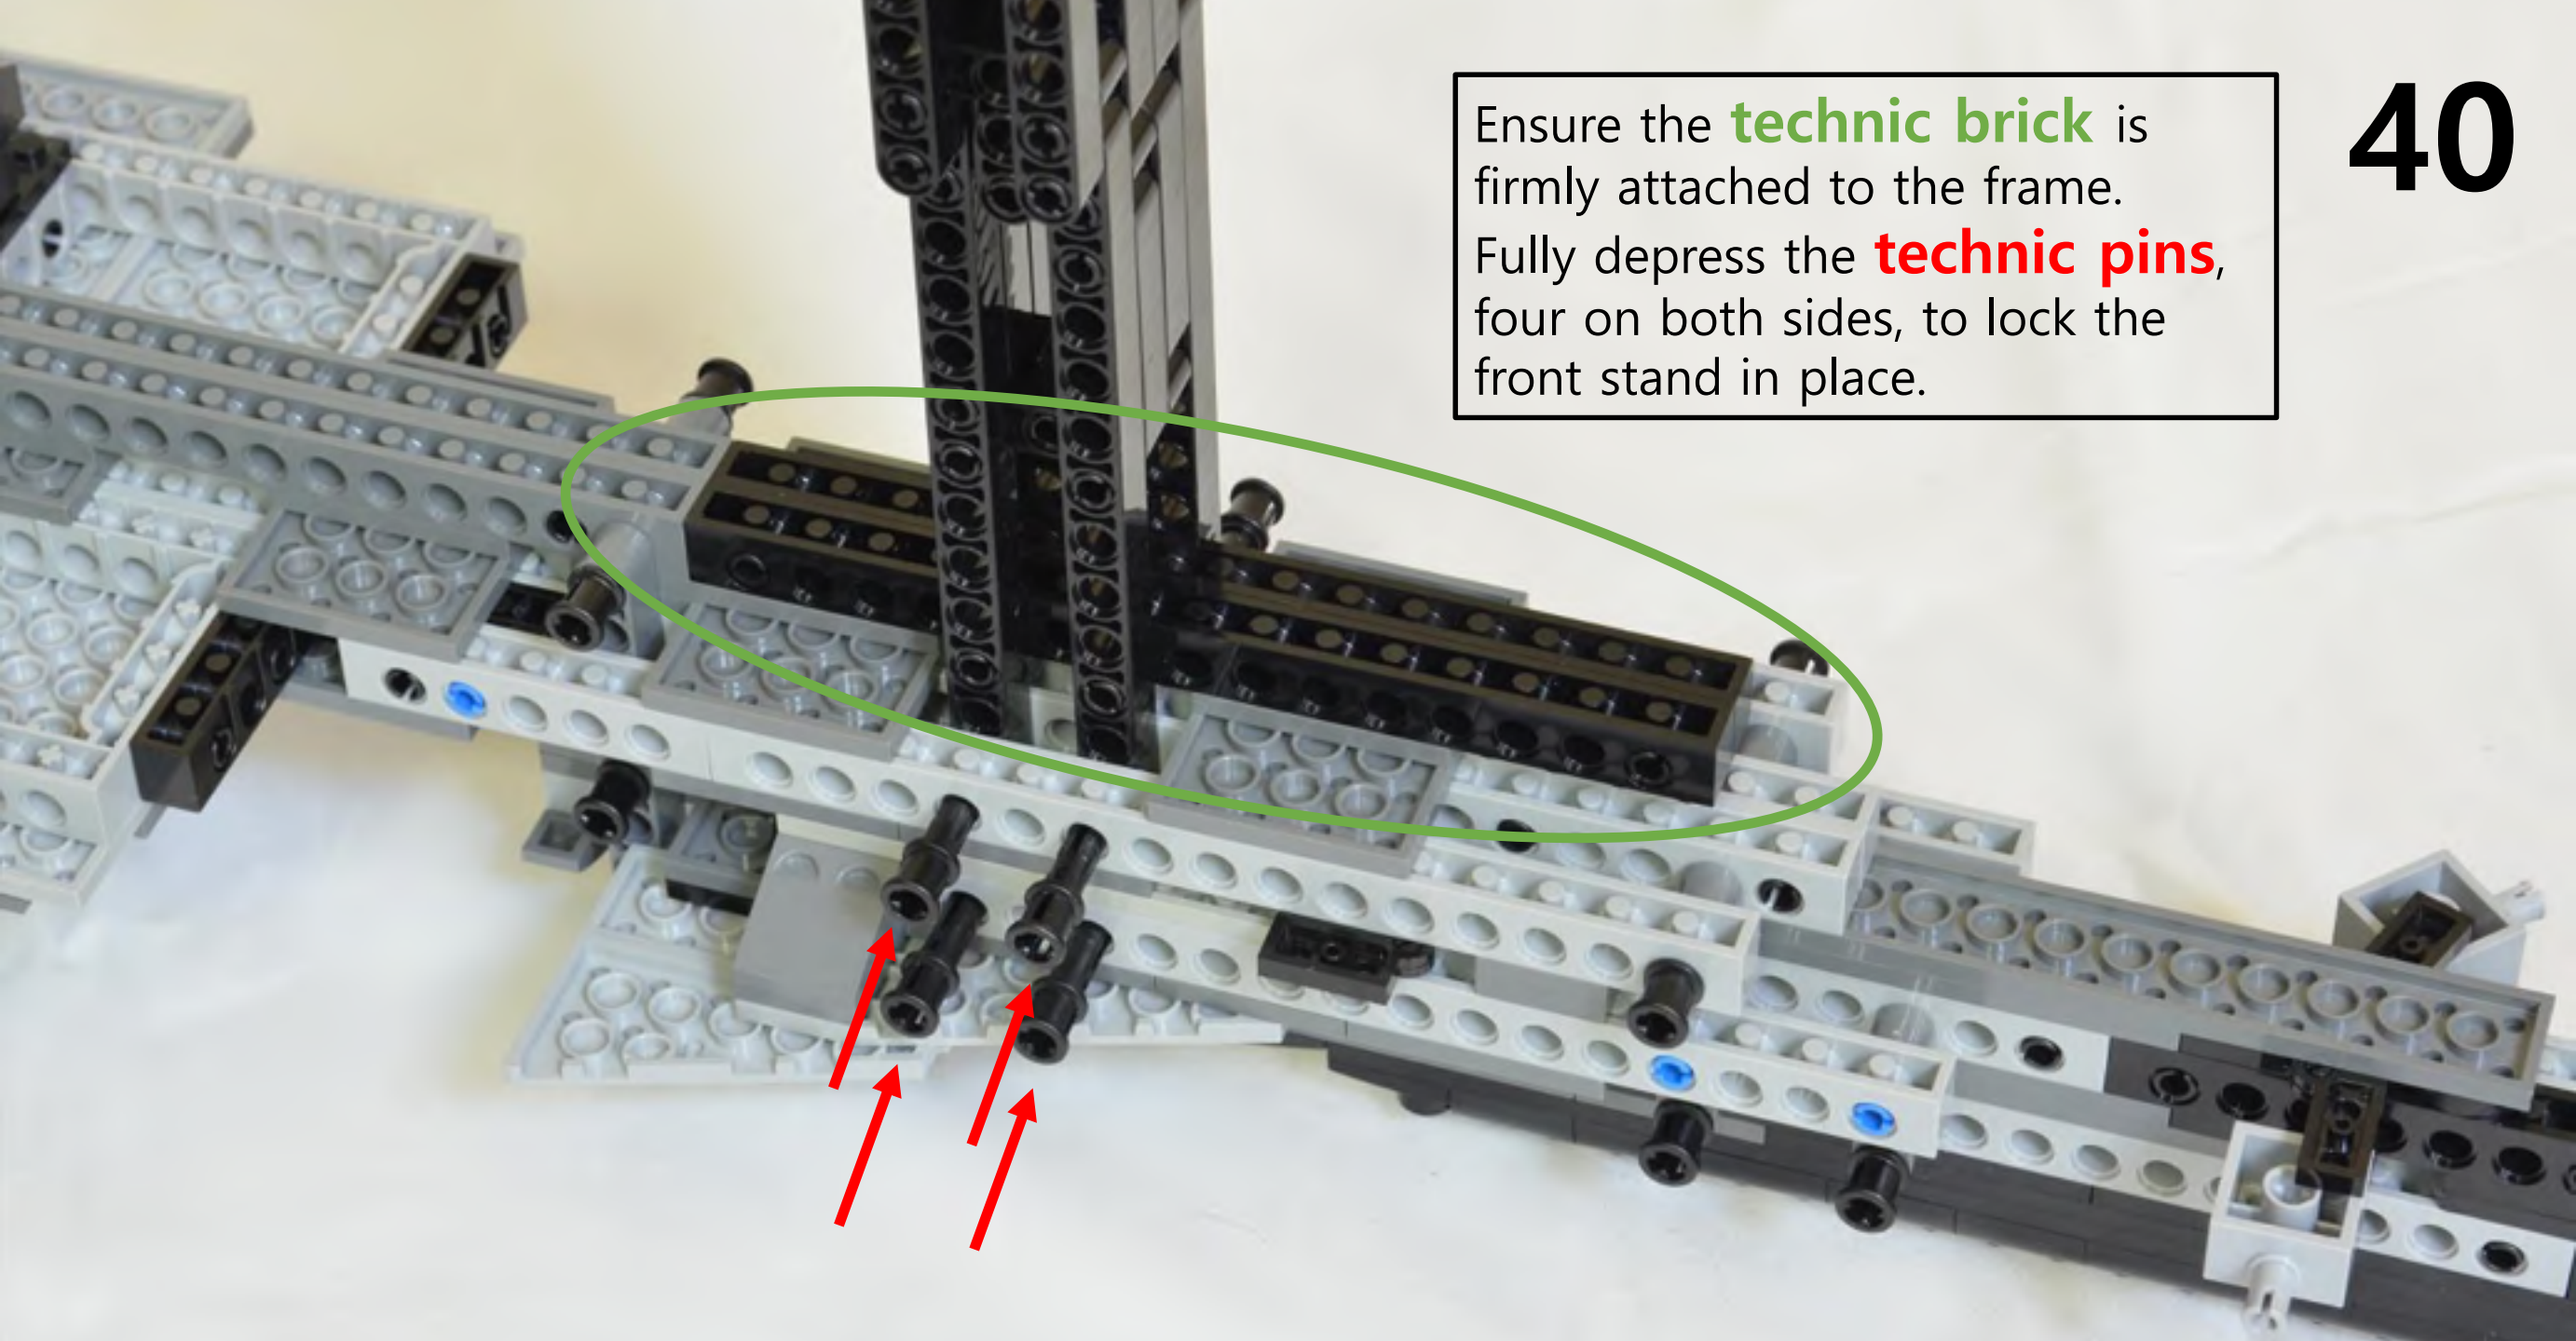


Attach the hangar bay to the bottom of the frame, lining up the **red plates** on the outside of the **black plates**.

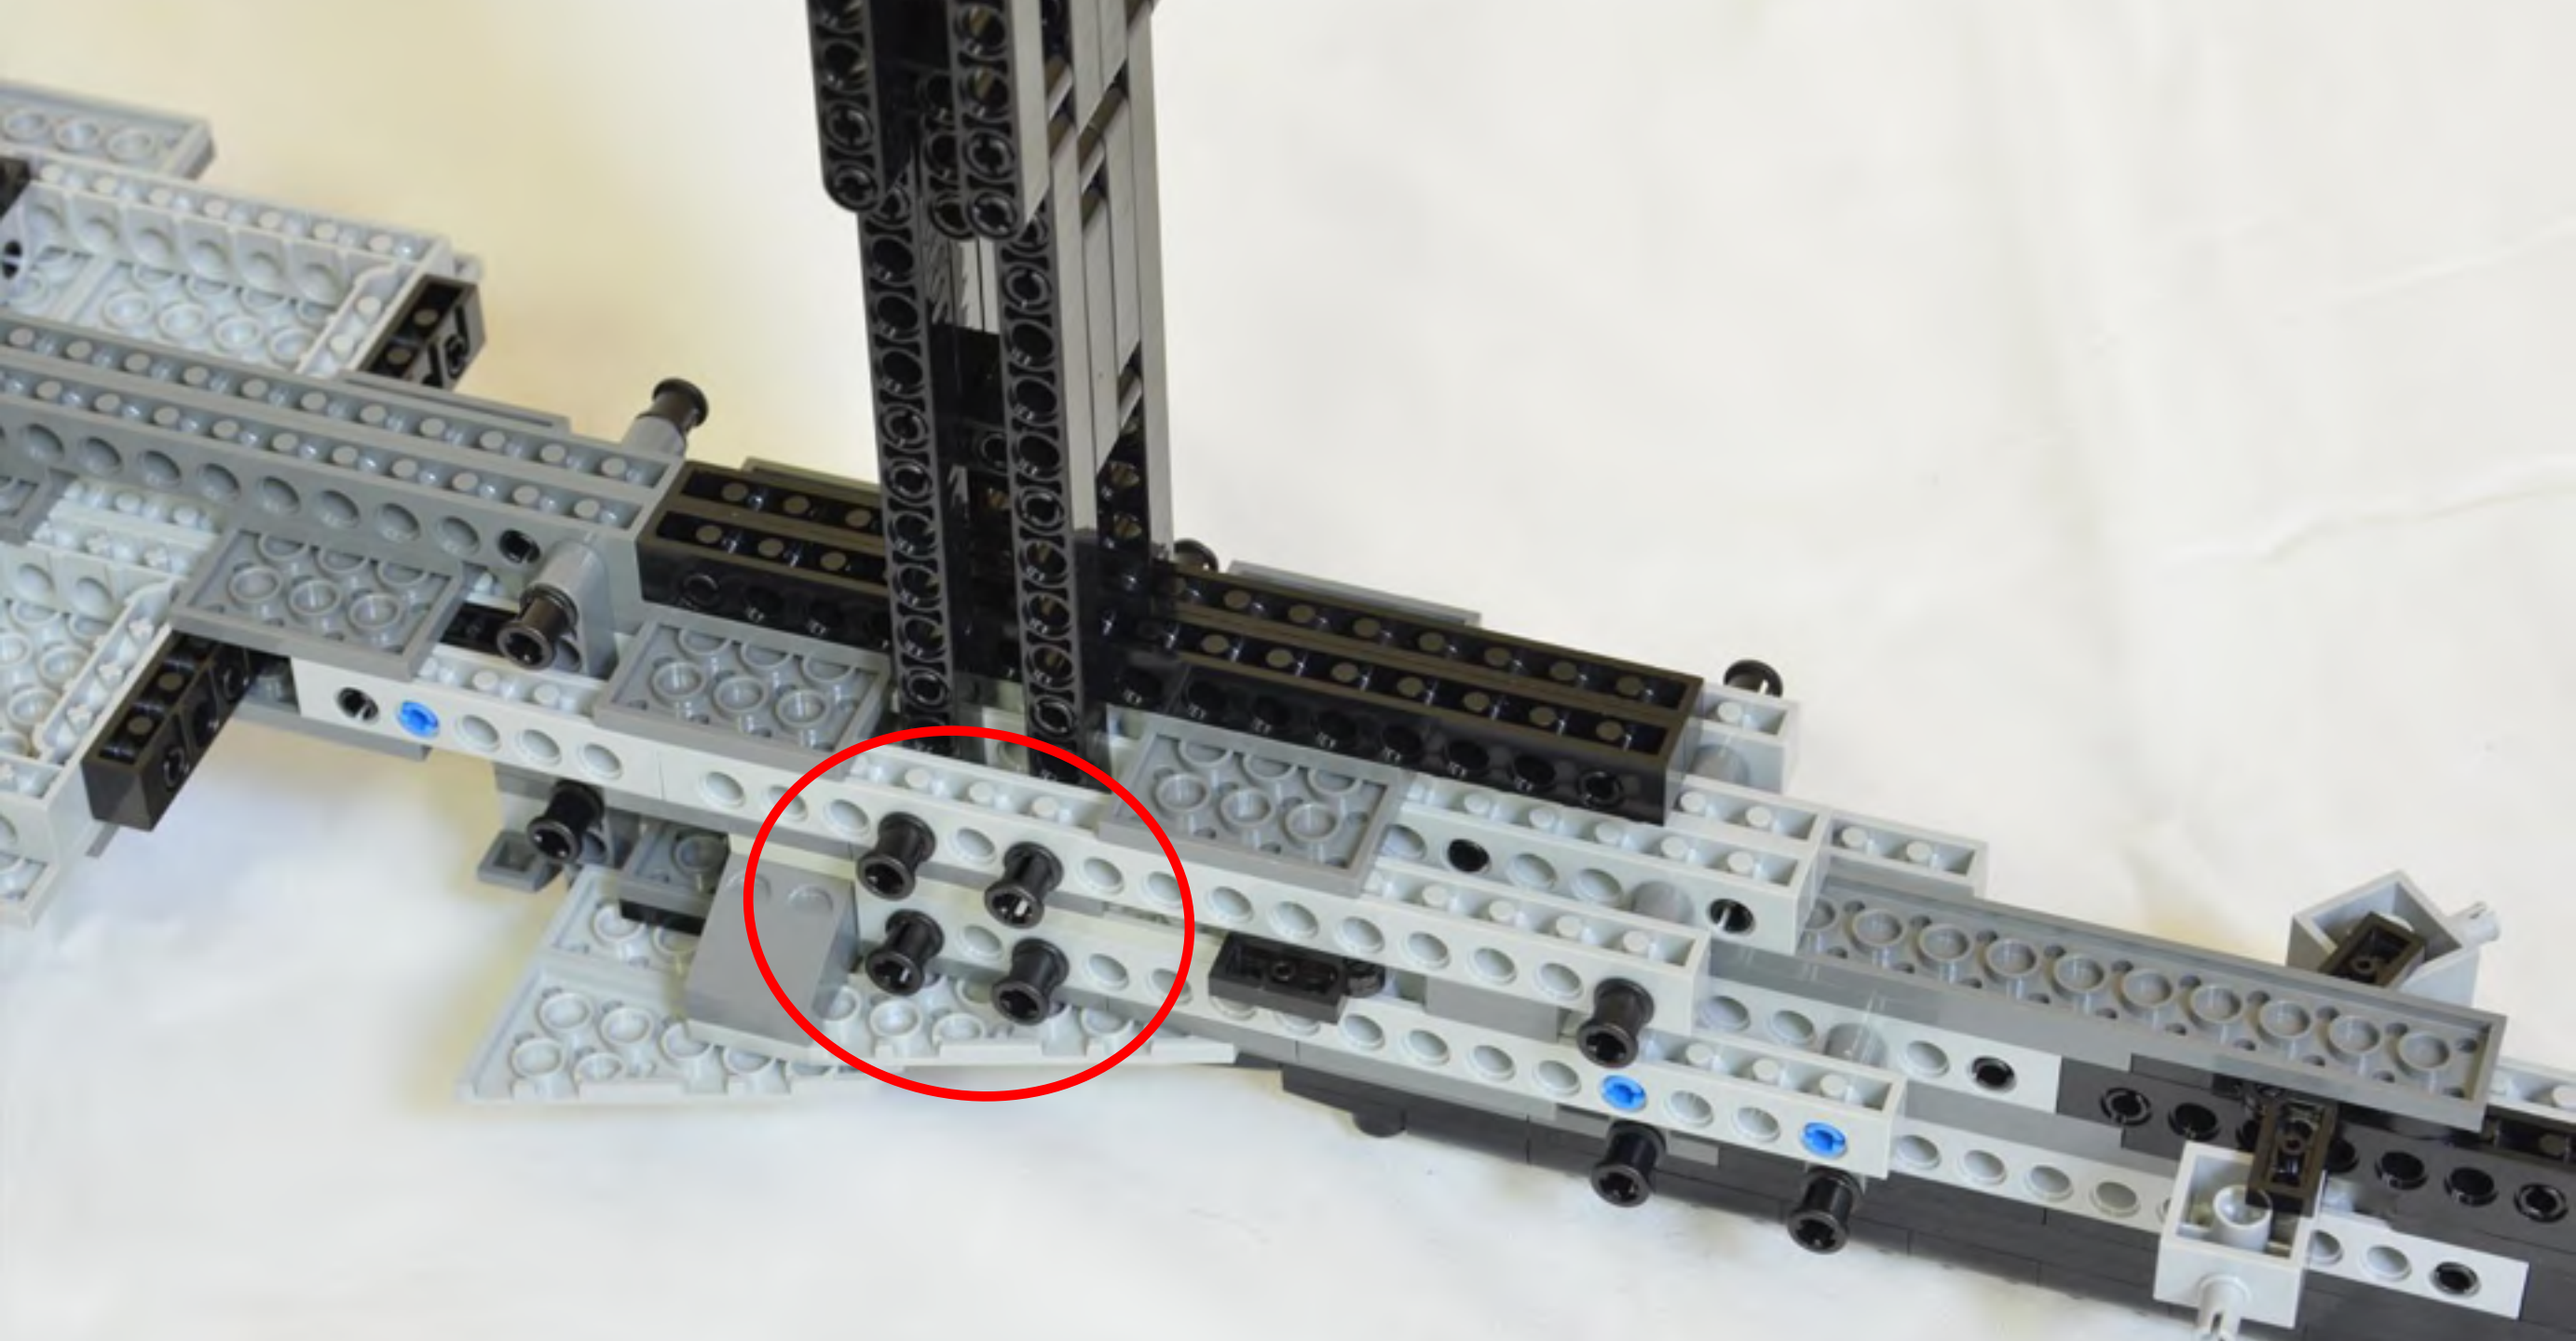




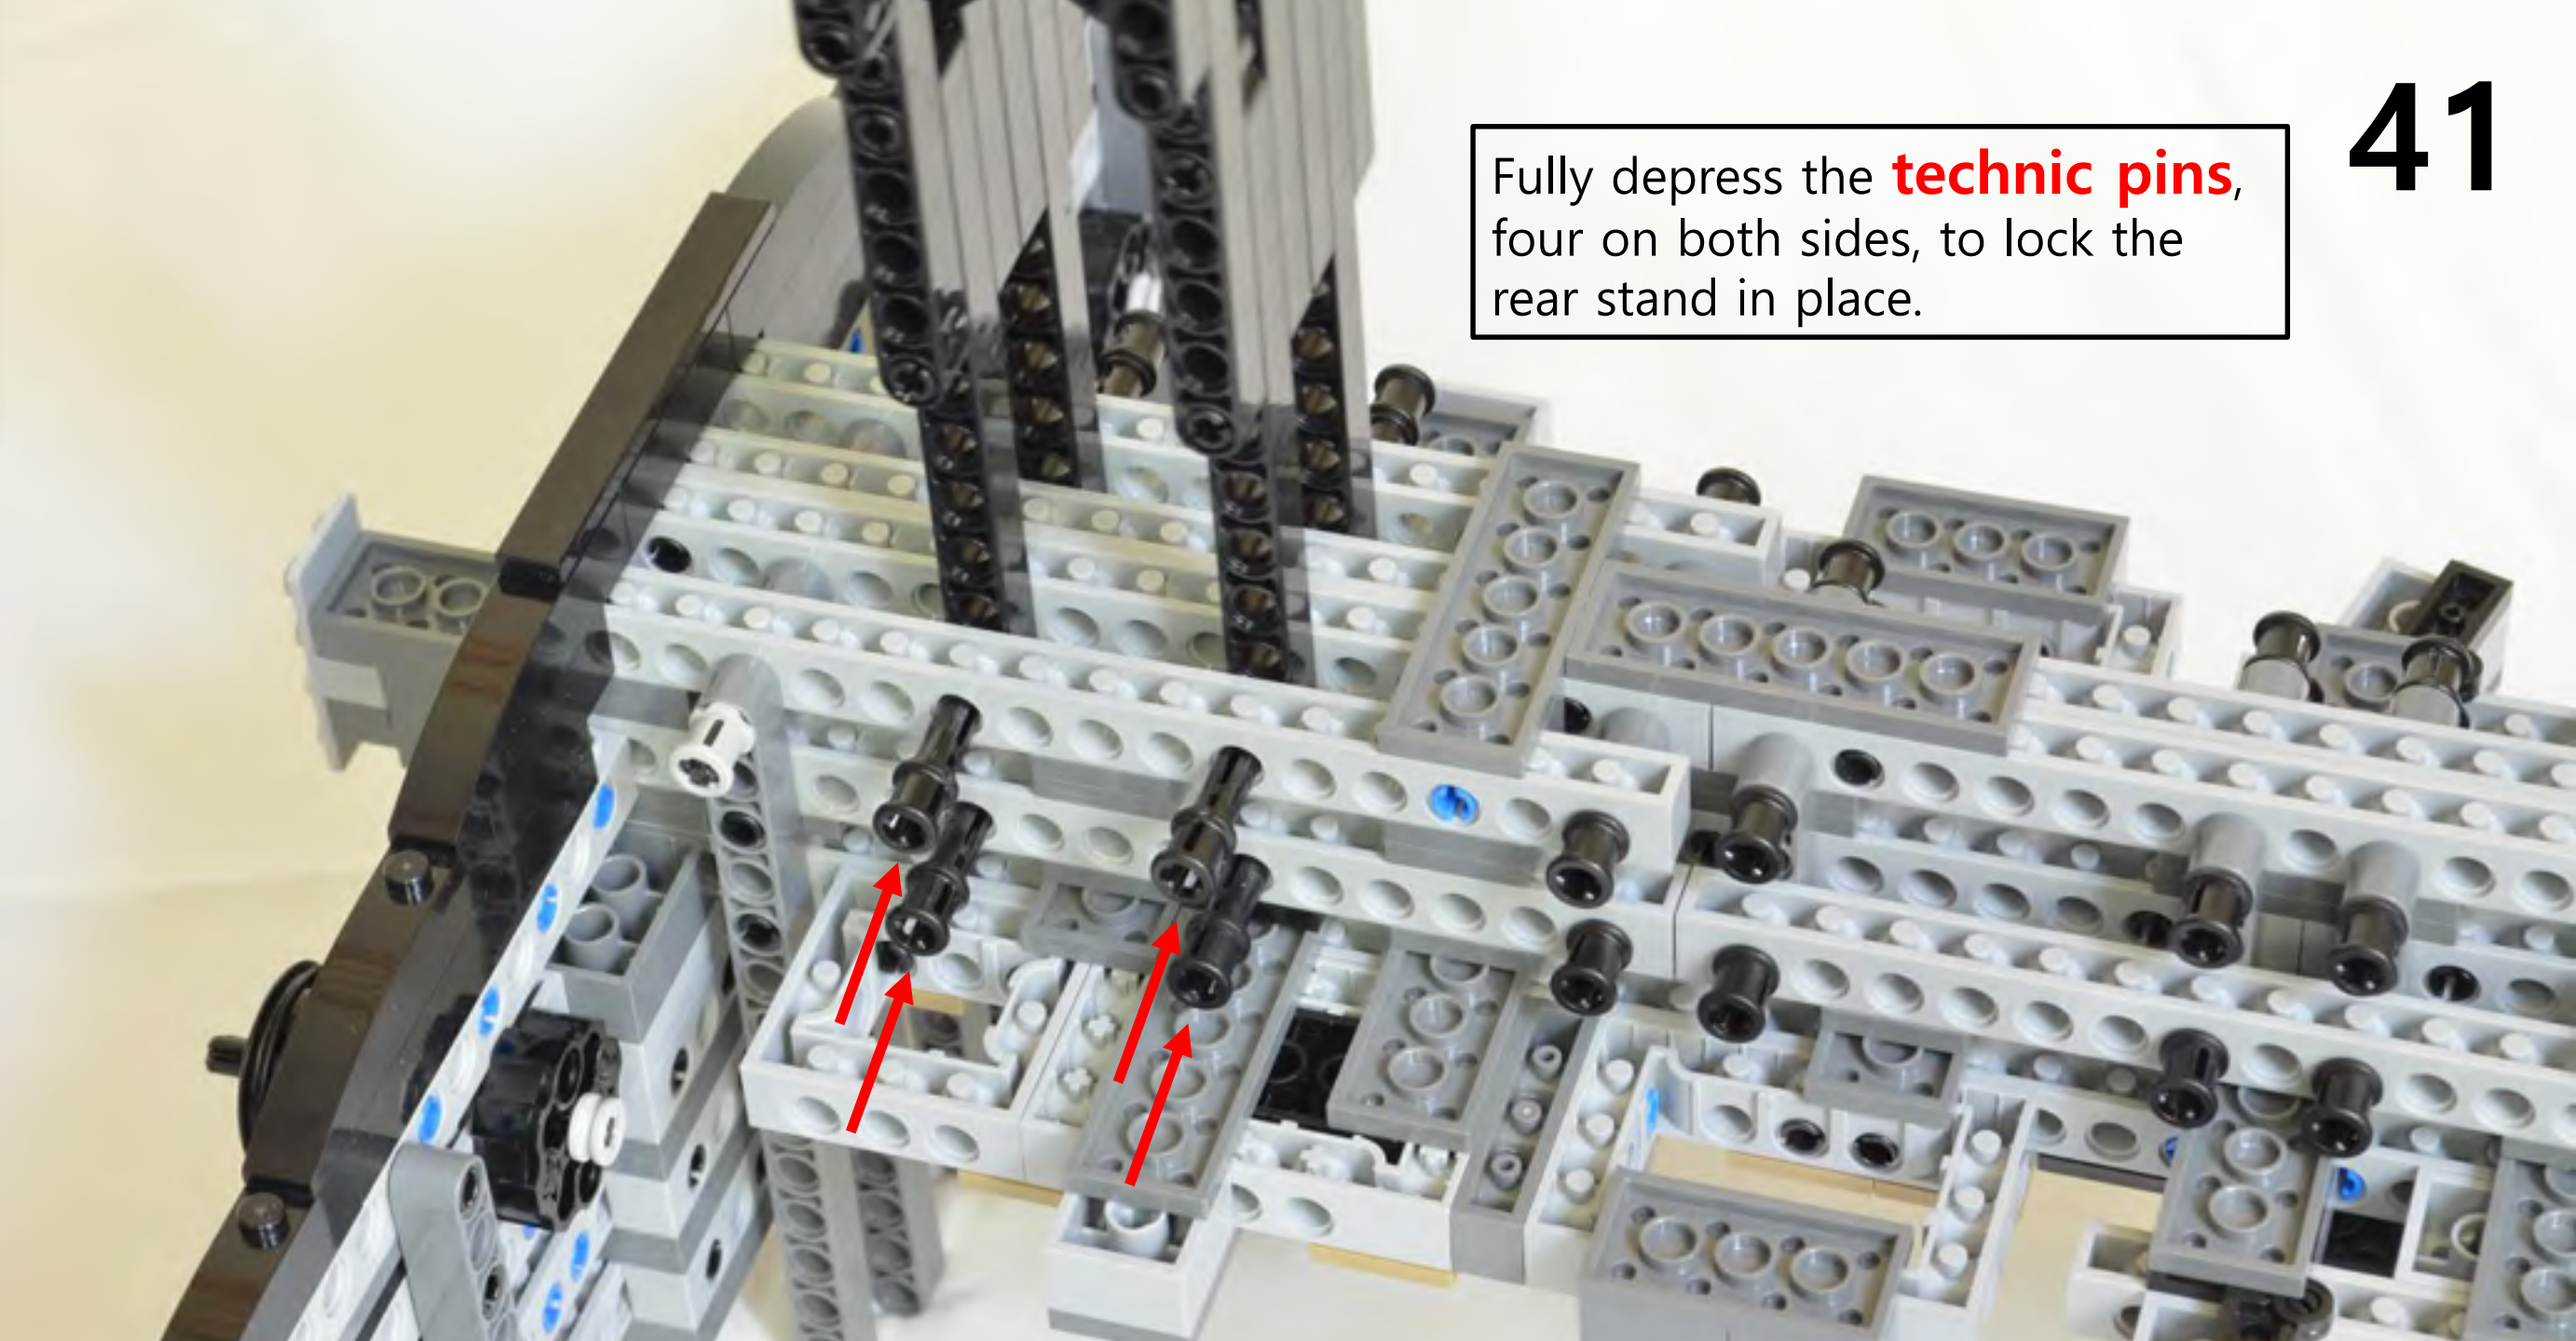
Attach the Front and Rear Stands by sliding the stands into the frame. This works best when the frame is flipped upside down.

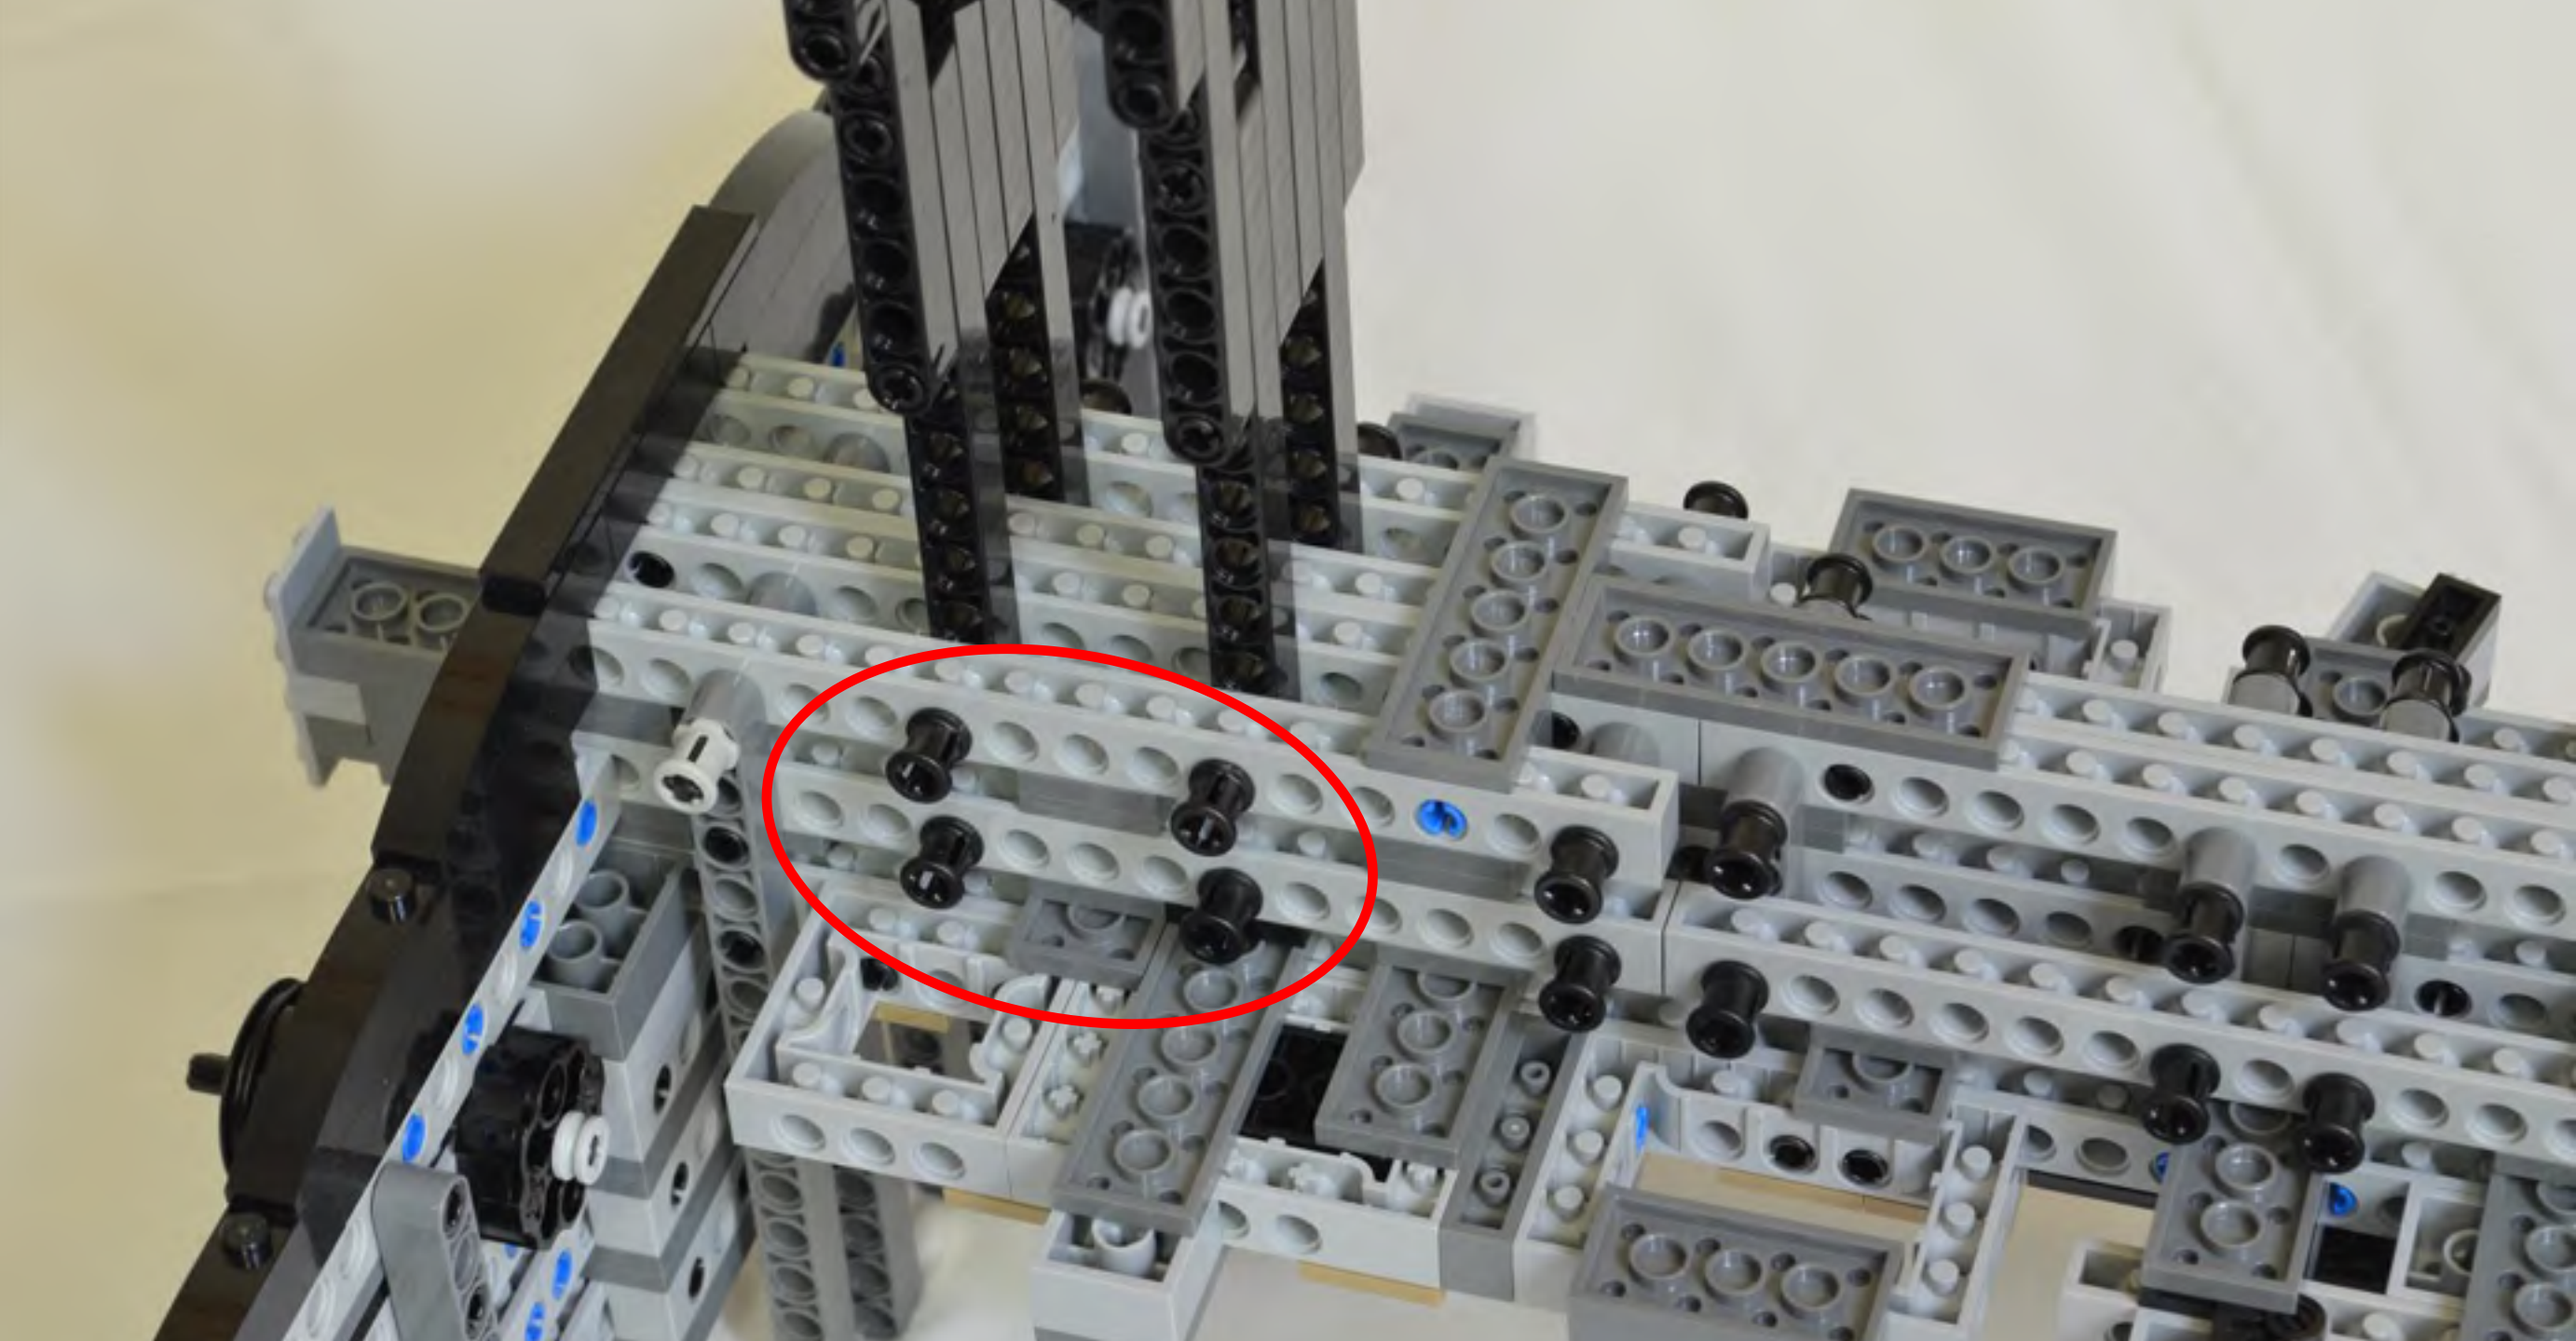


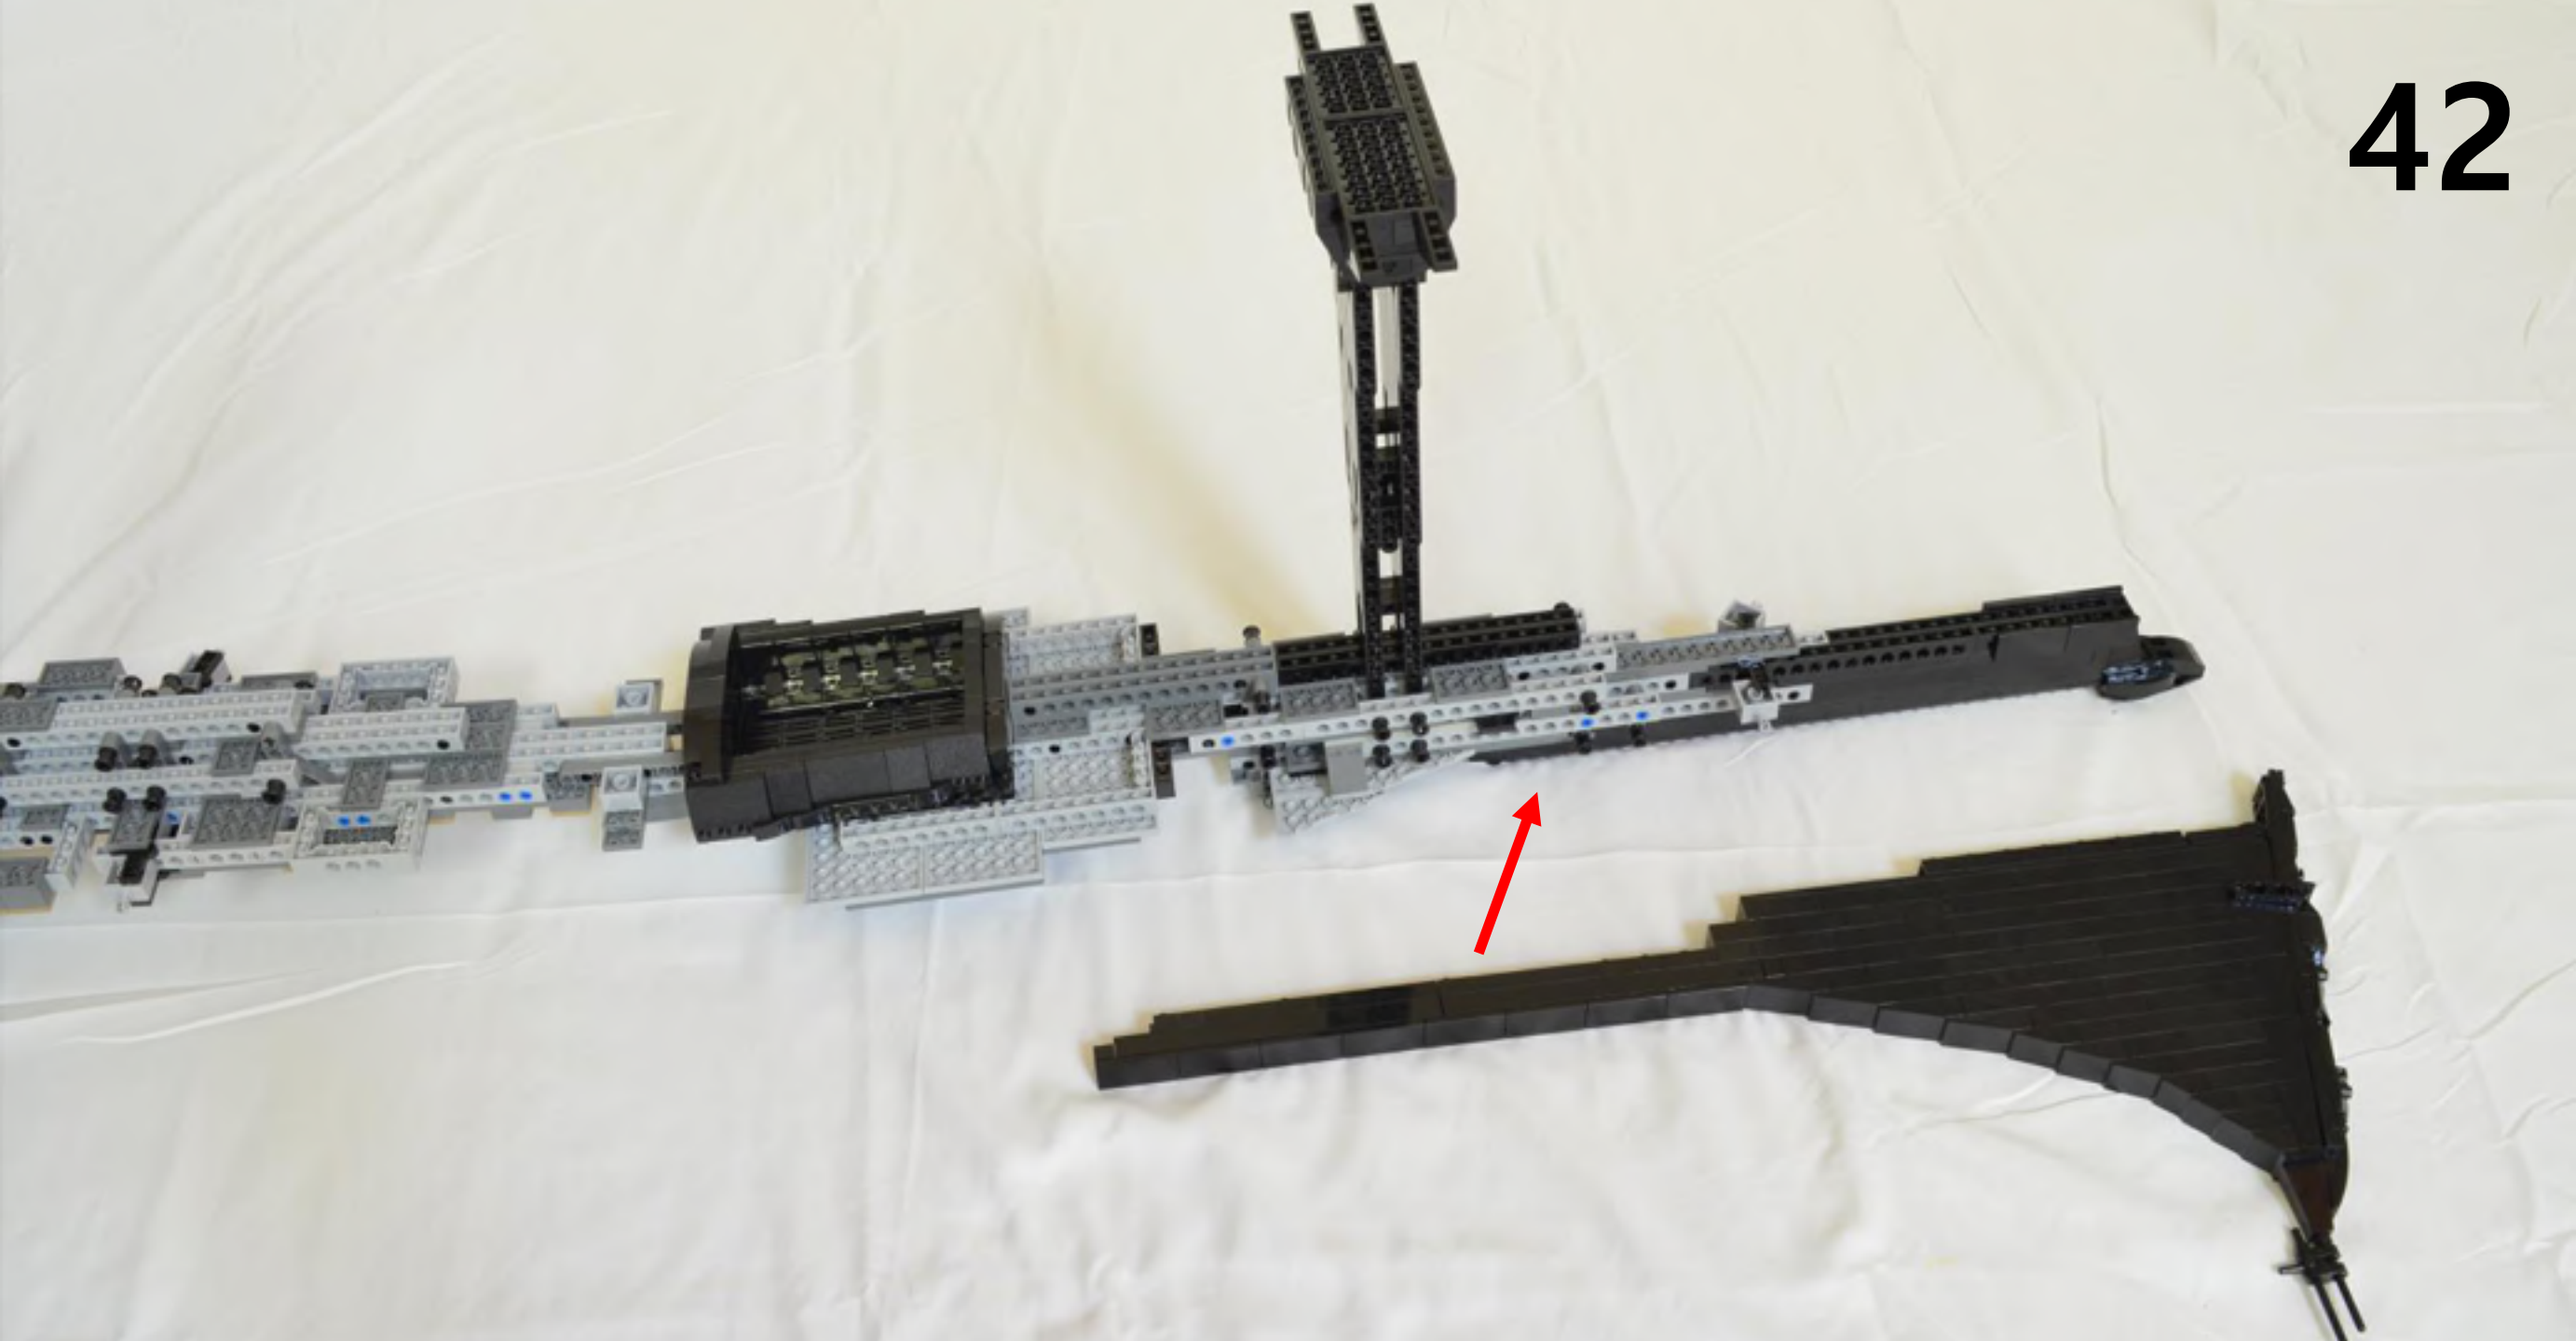
Ensure the technic brick is firmly attached to the frame.
Fully depress the technic pins, four on both sides, to lock the front stand in place.
40

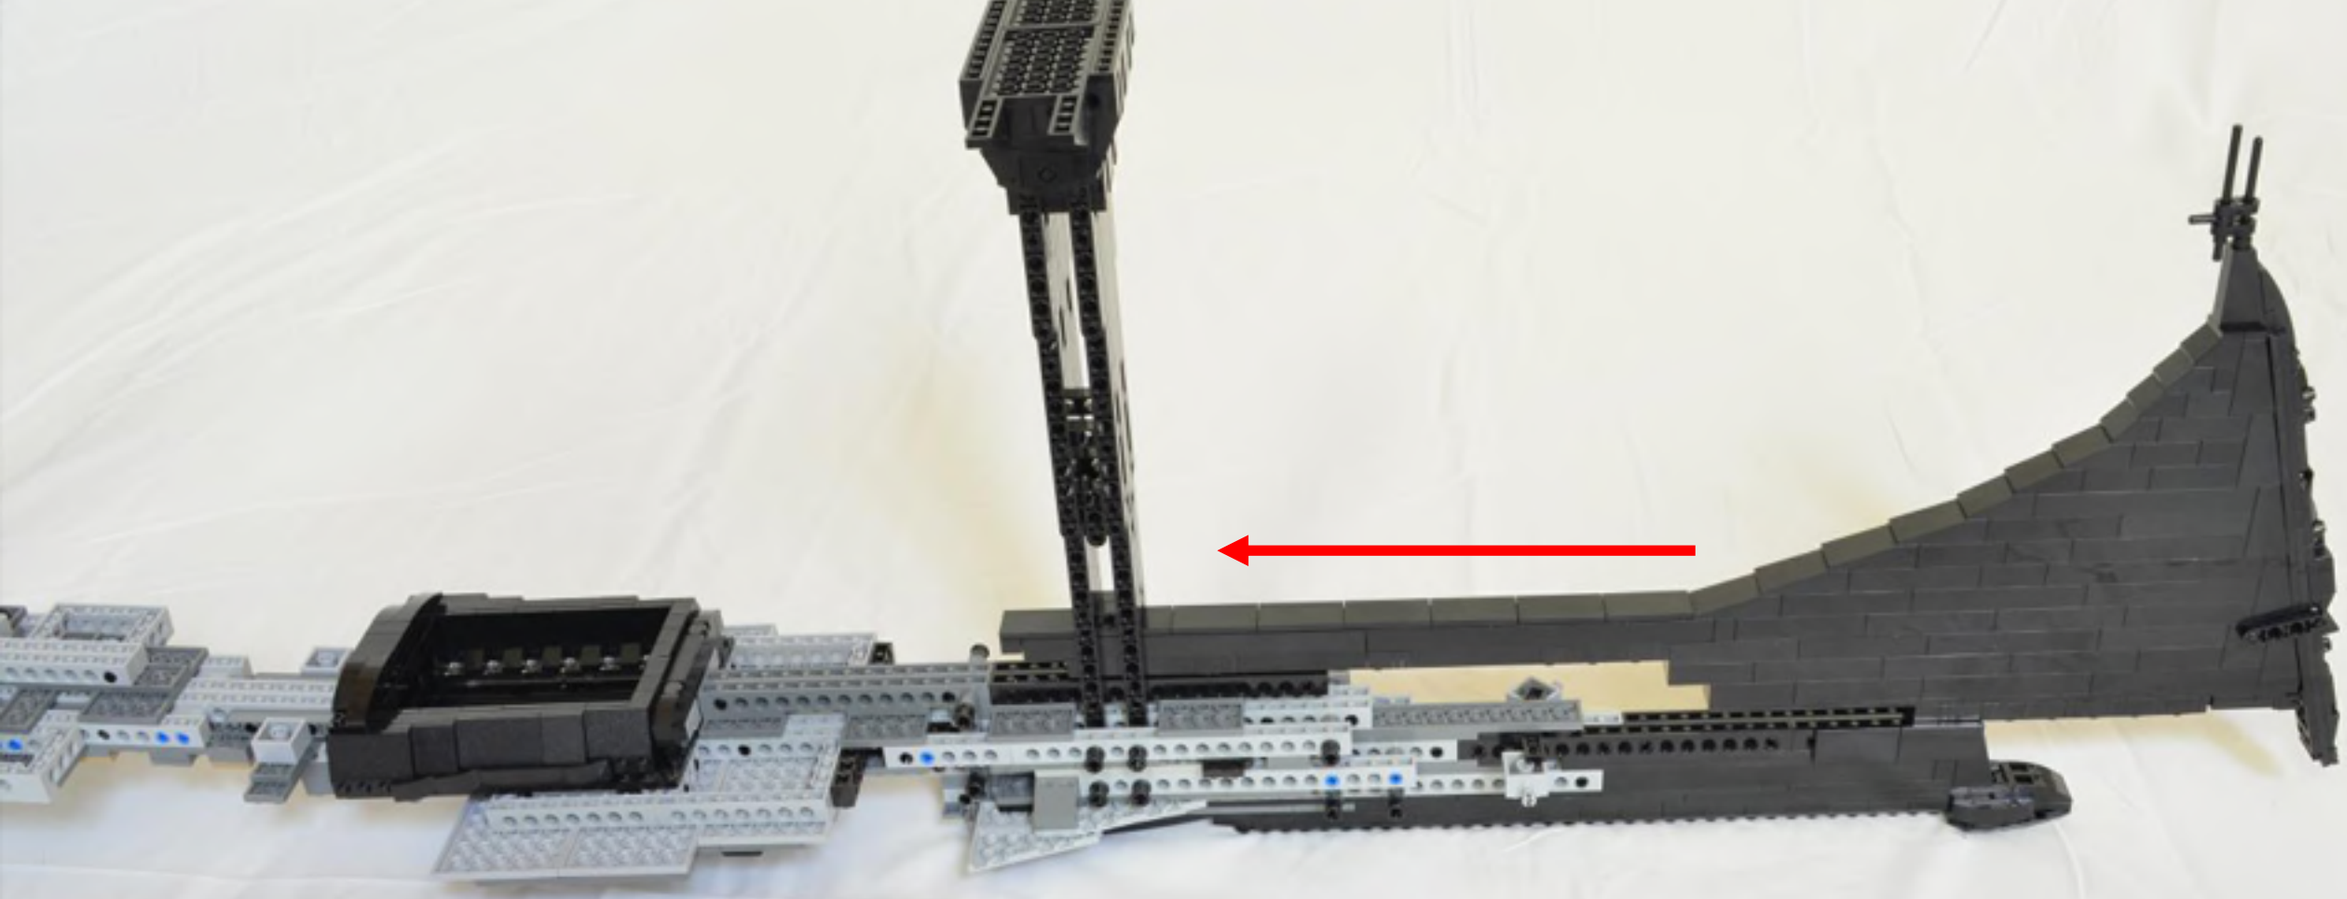


Fully depress the **technic pins**, four on both sides, to lock the rear stand in place.

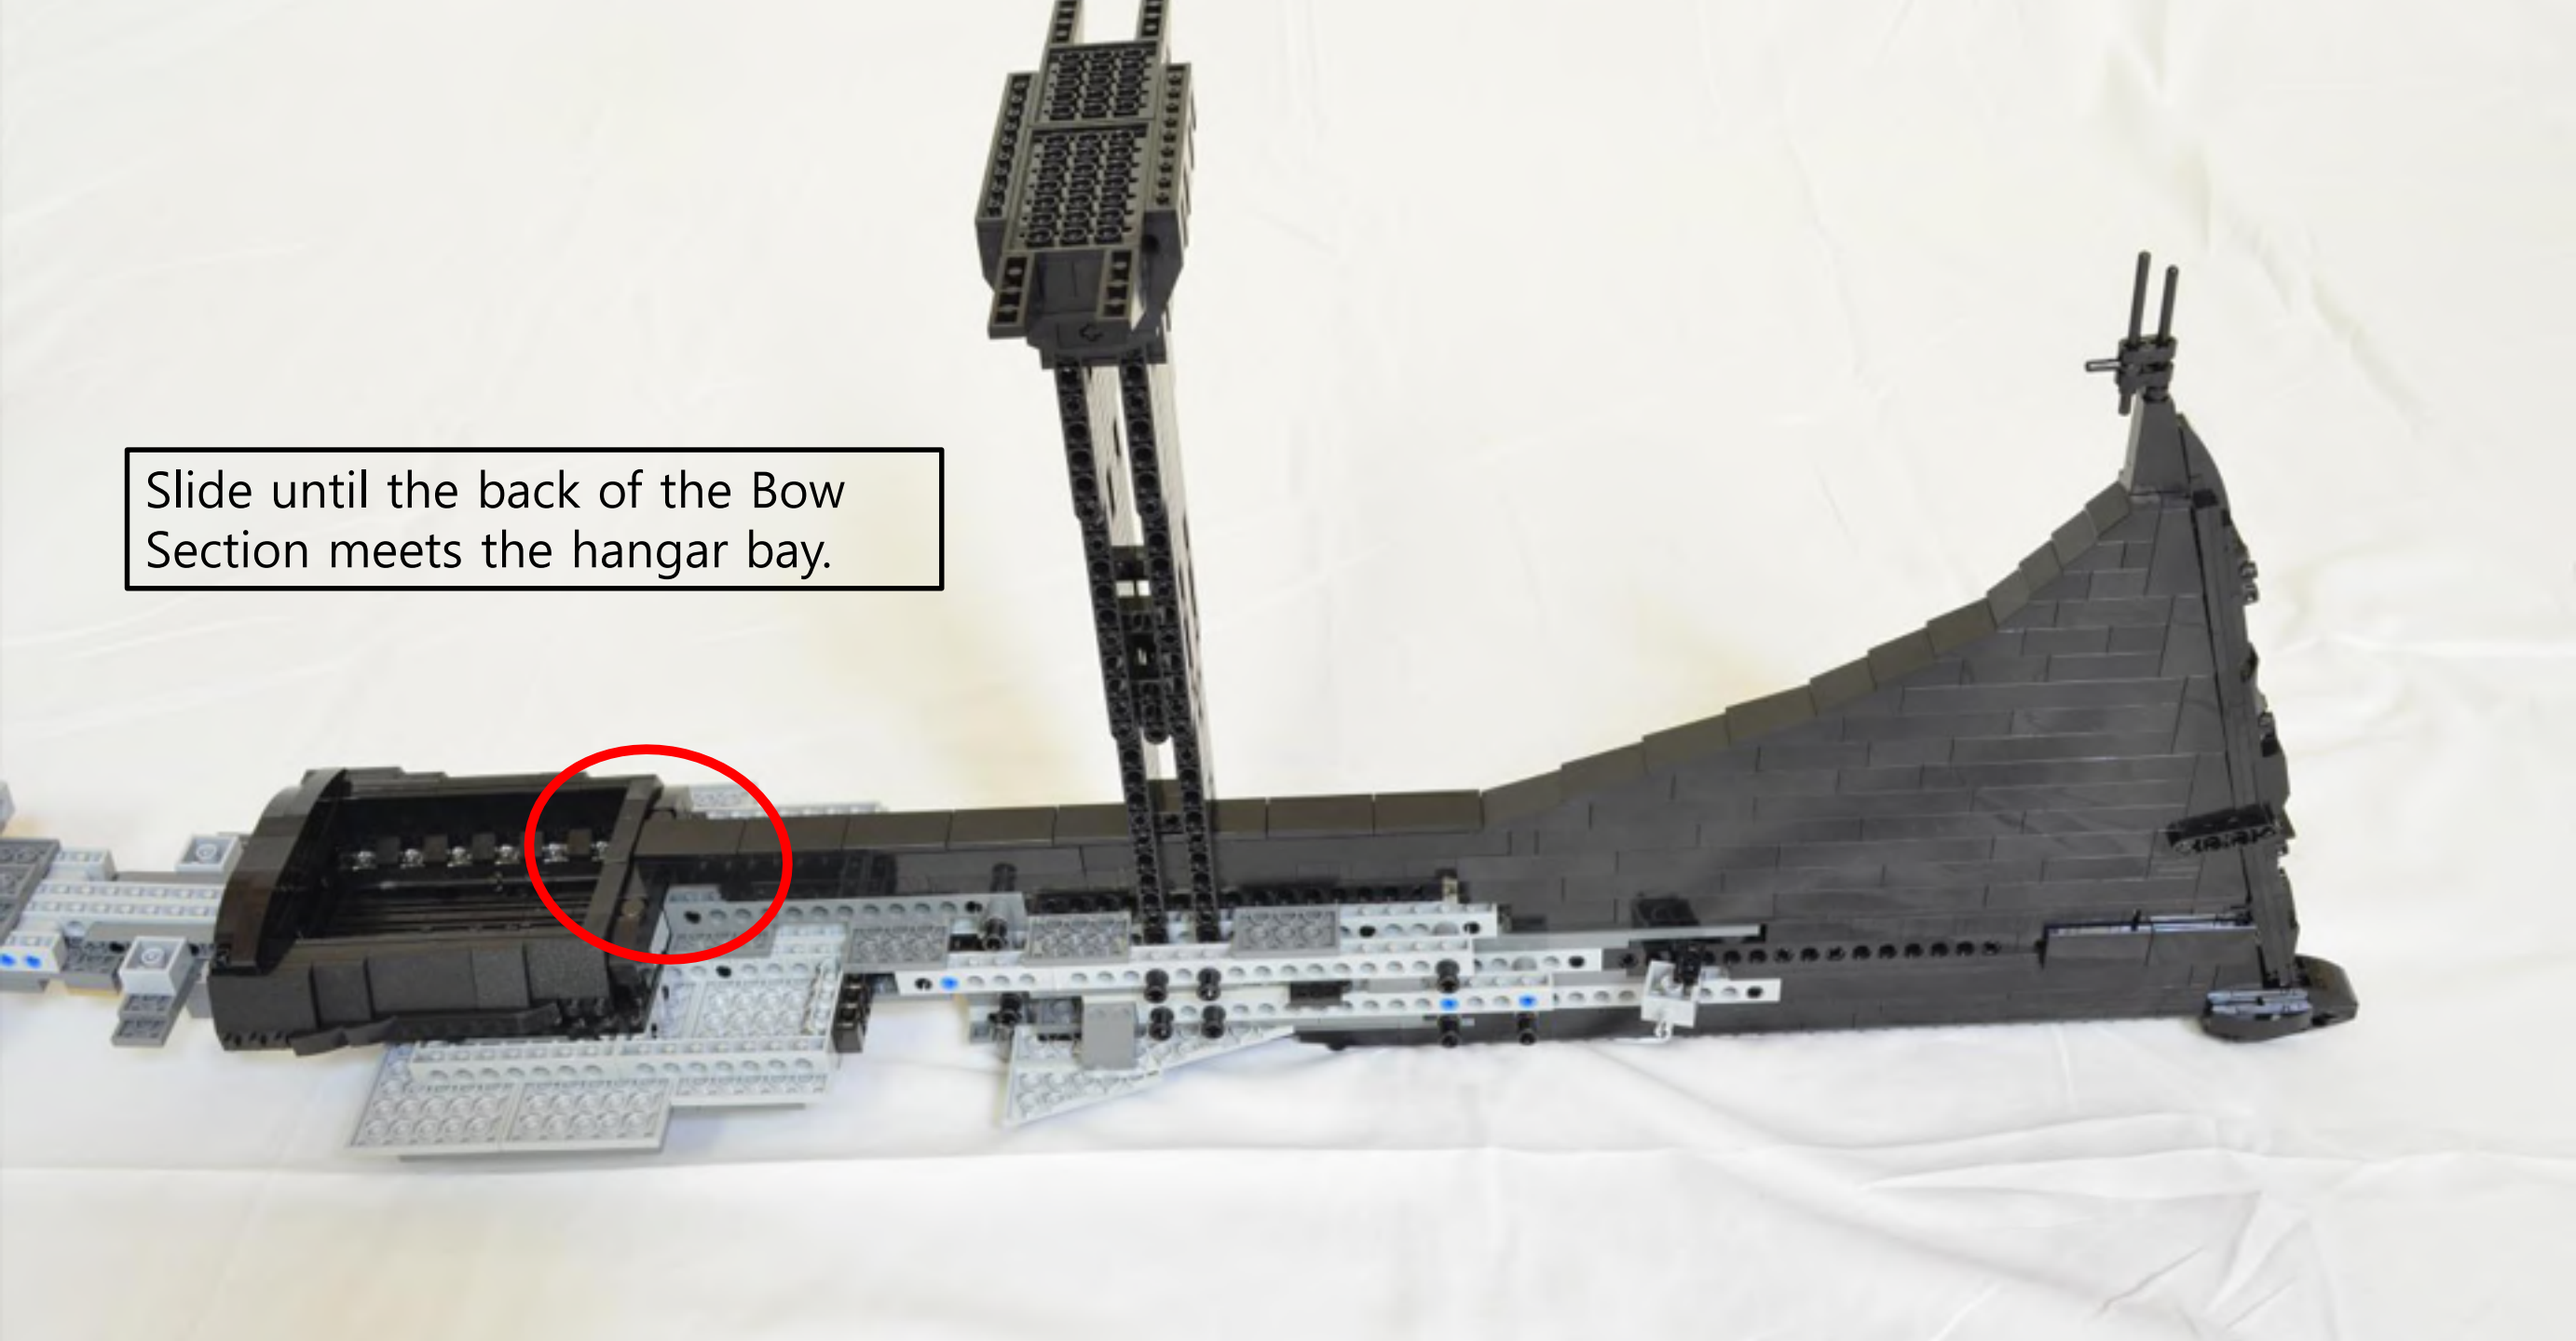




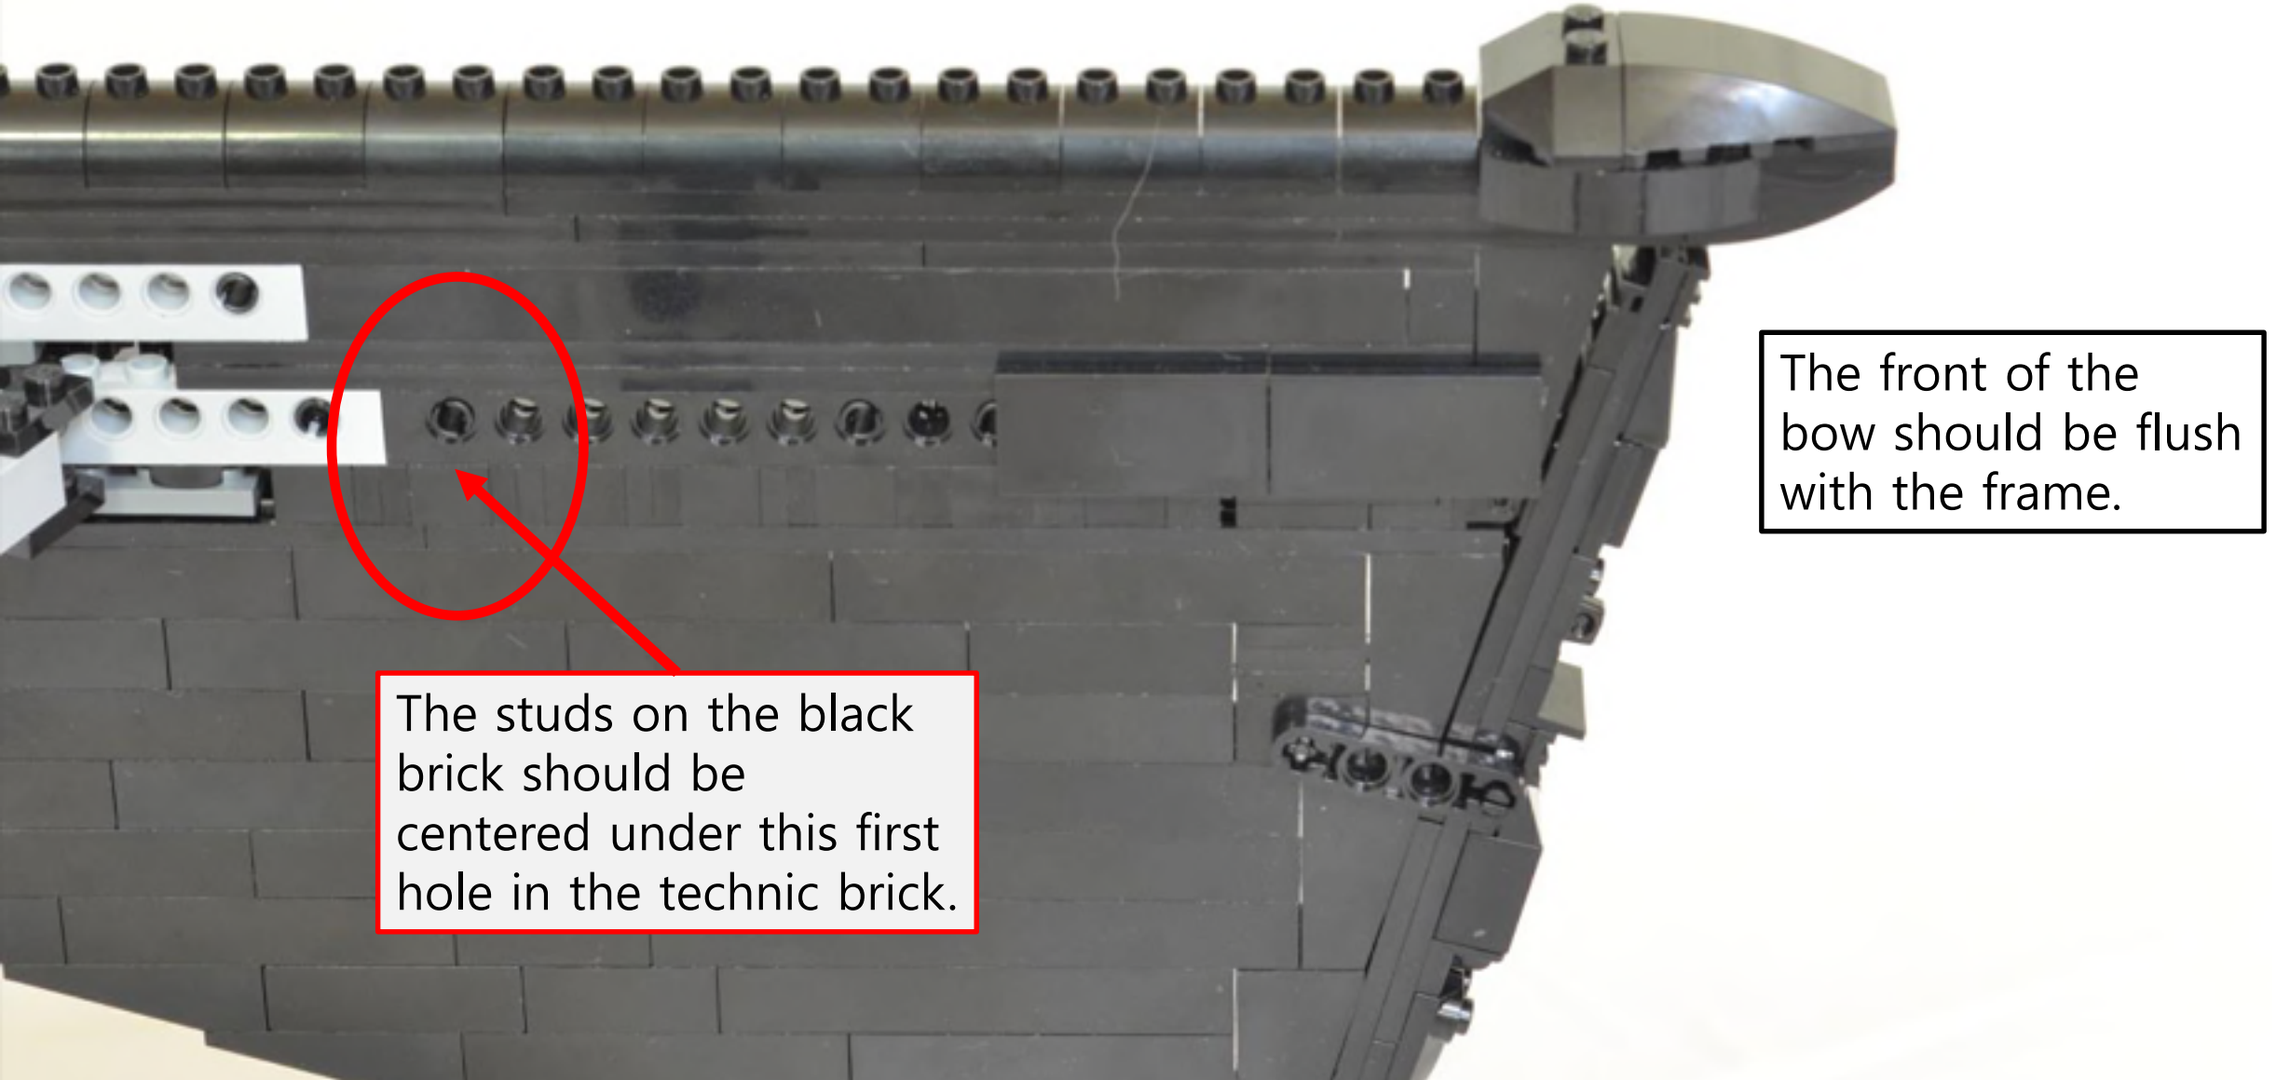




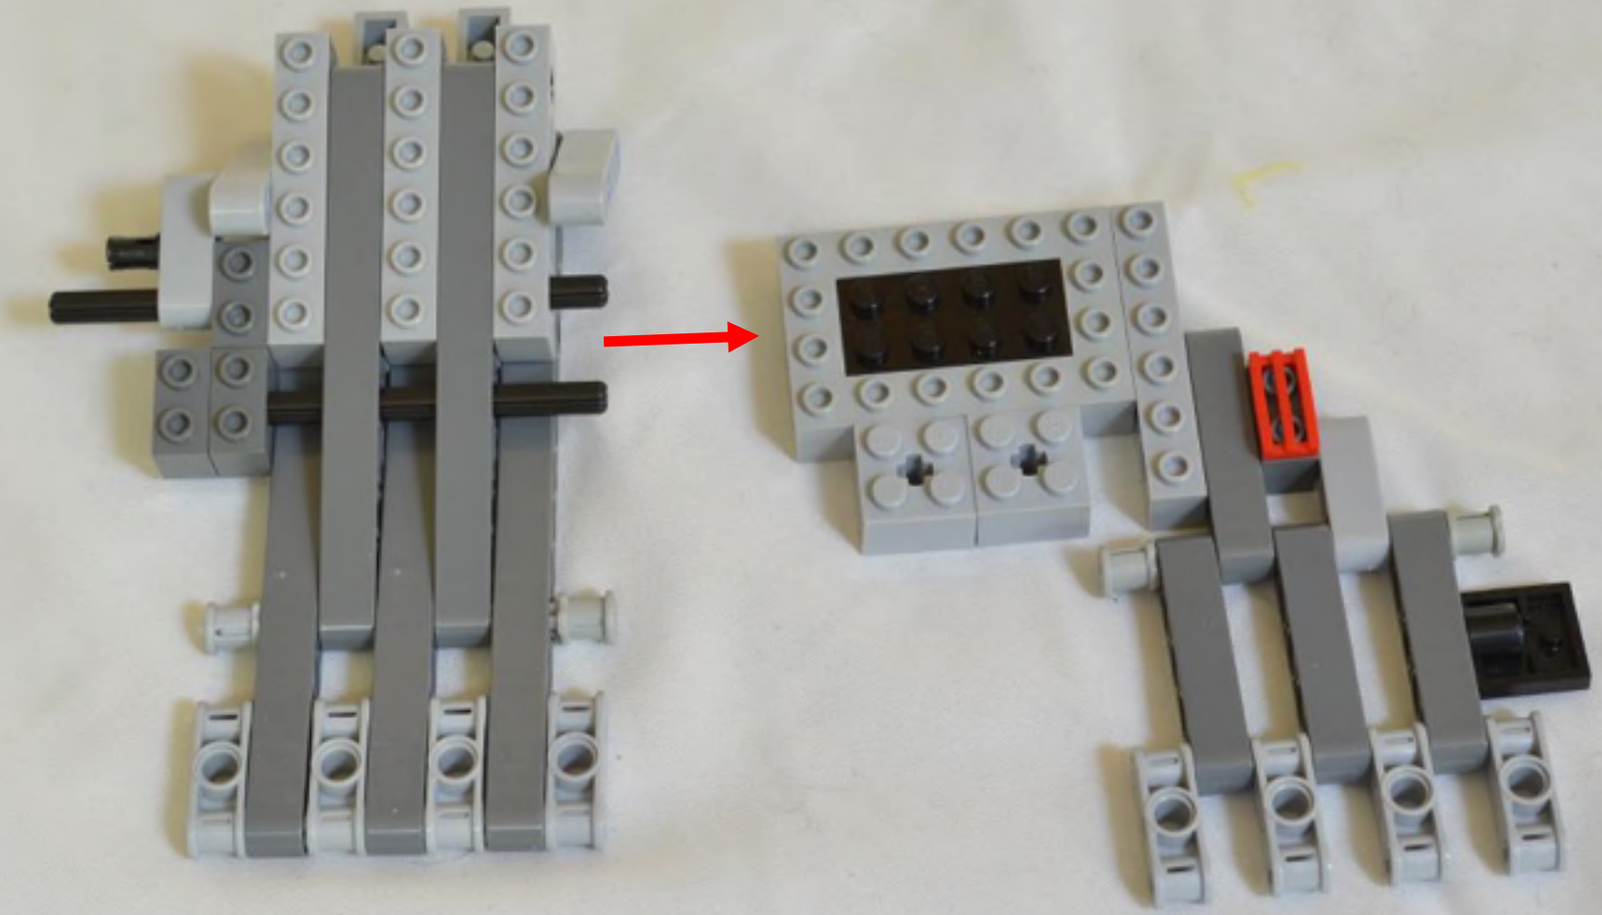
Slide the bow through the Front Stand legs towards the hangar bay.

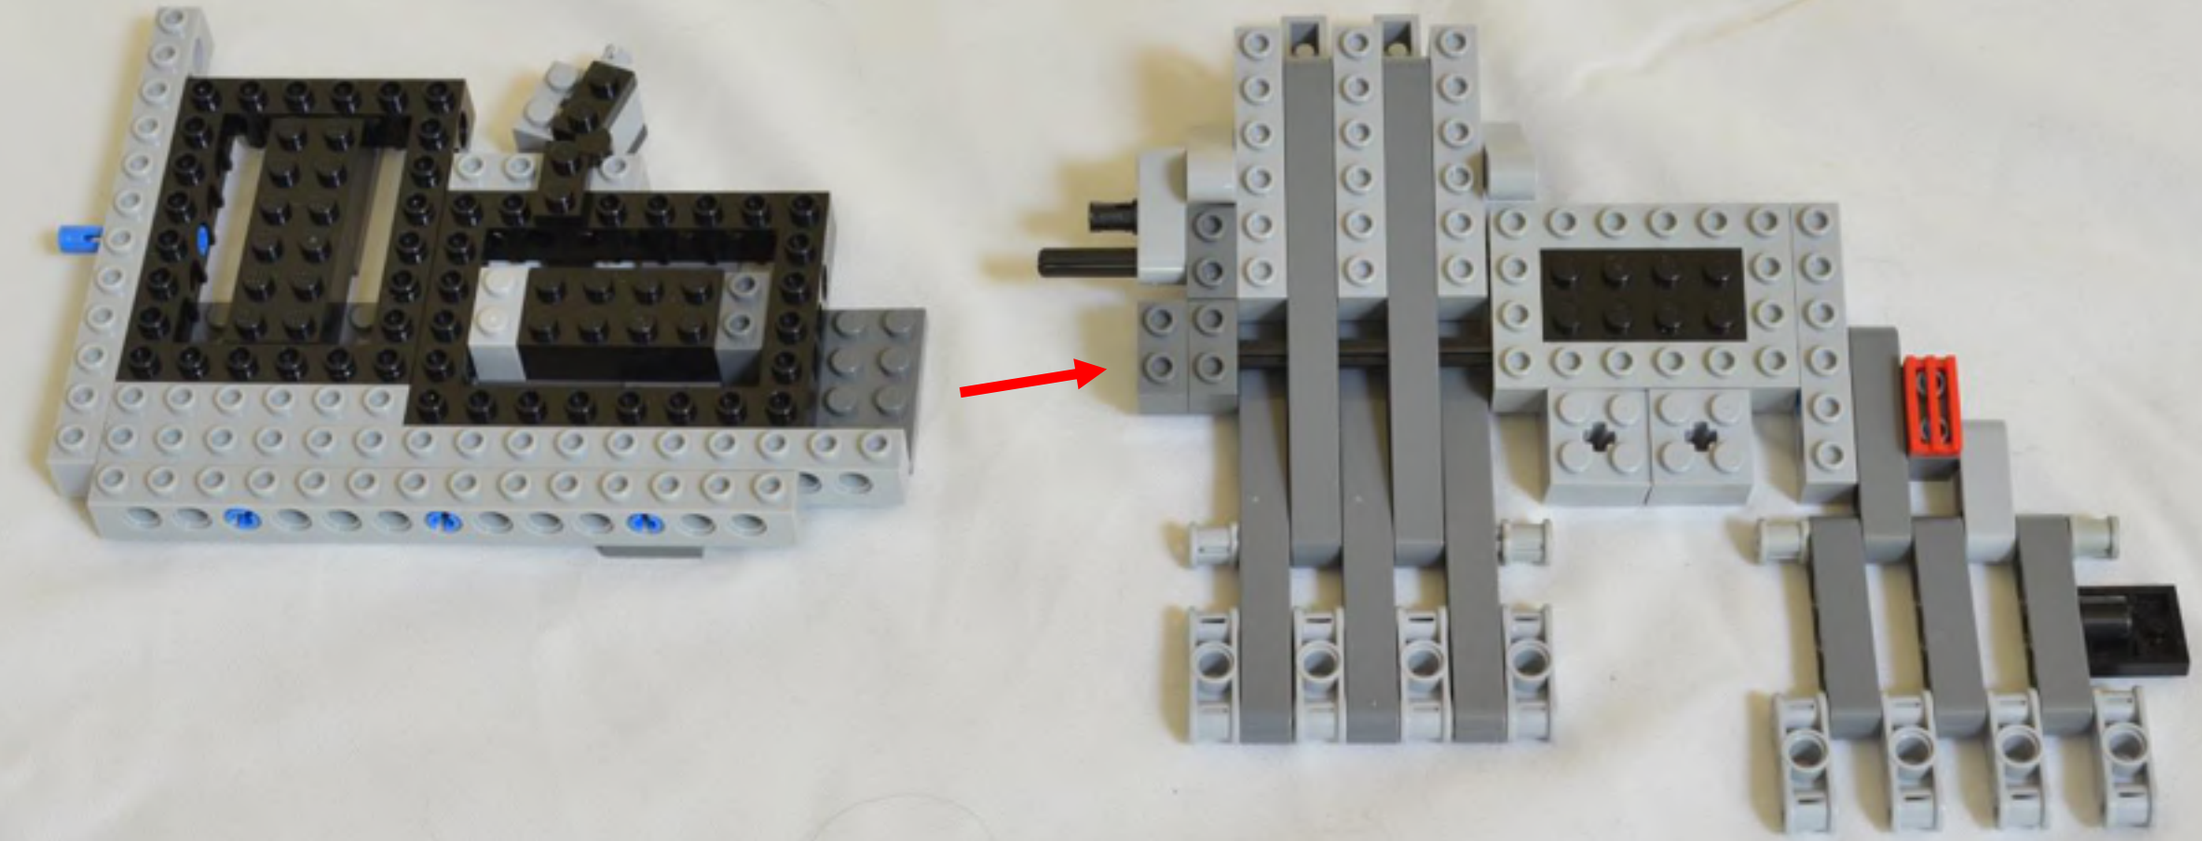


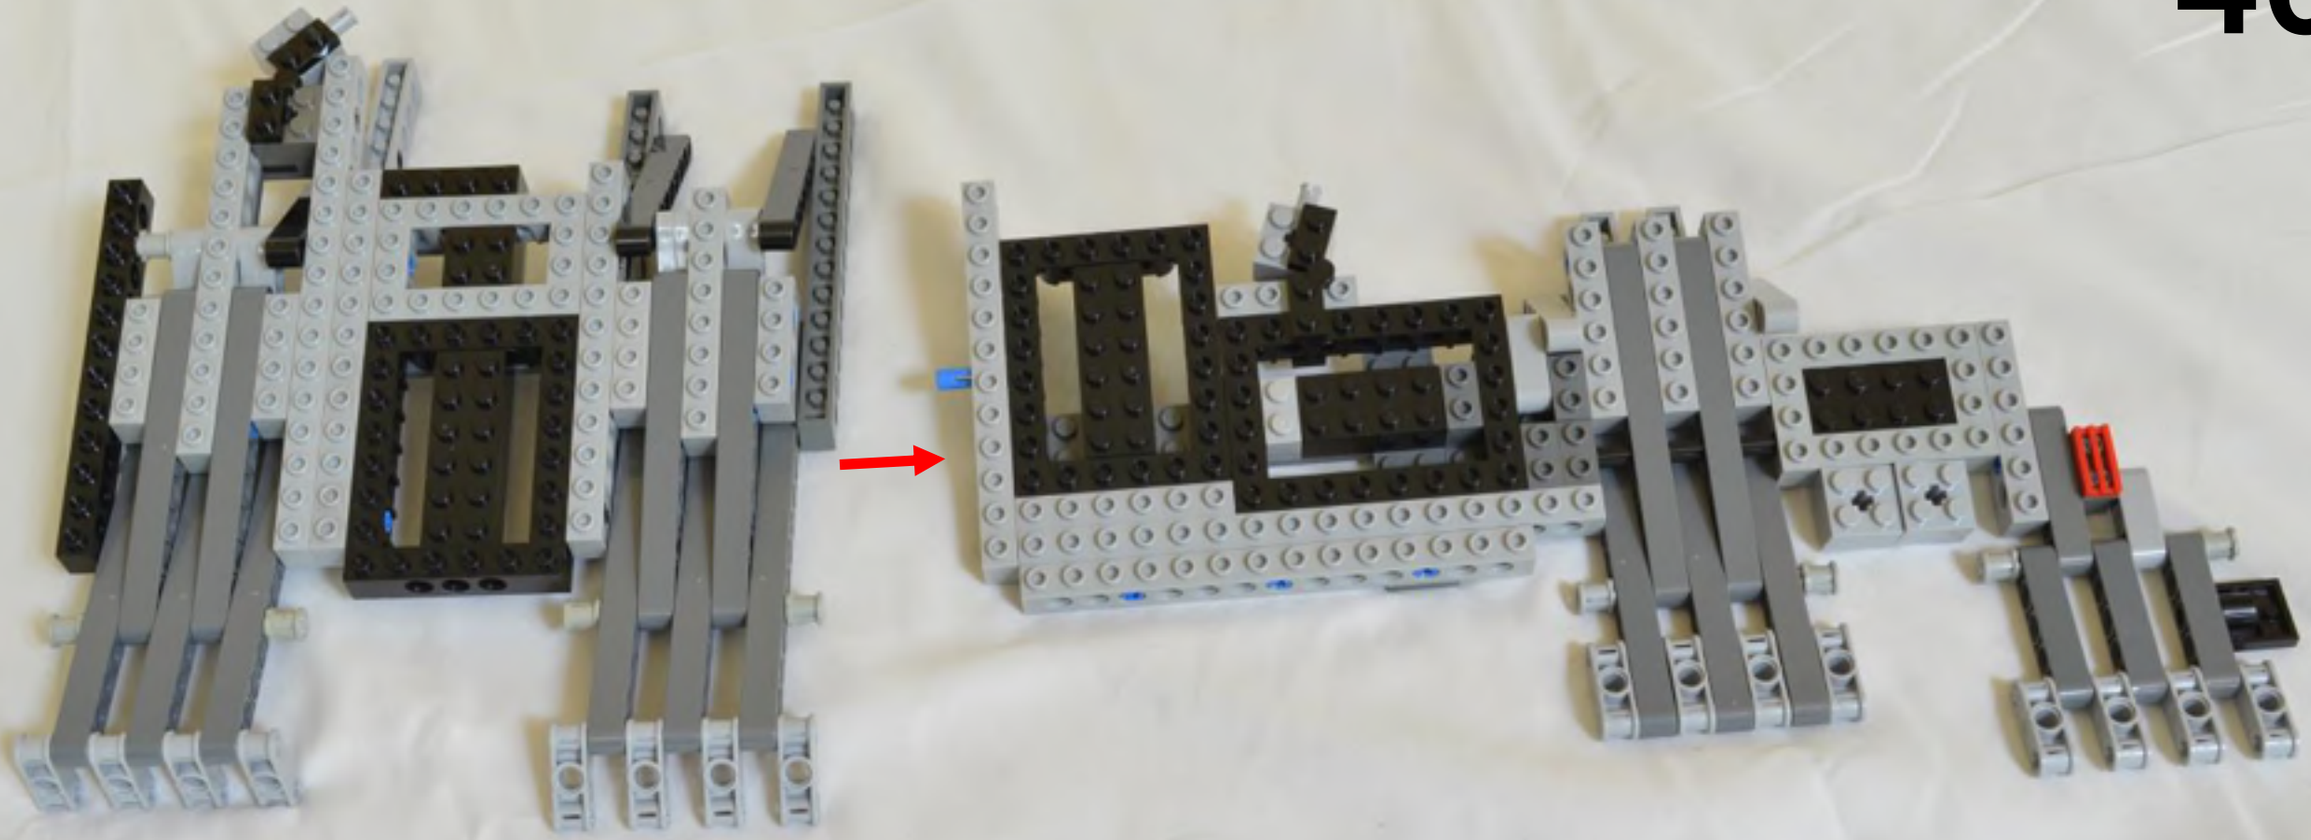
Slide until the back of the Bow Section meets the hangar bay.

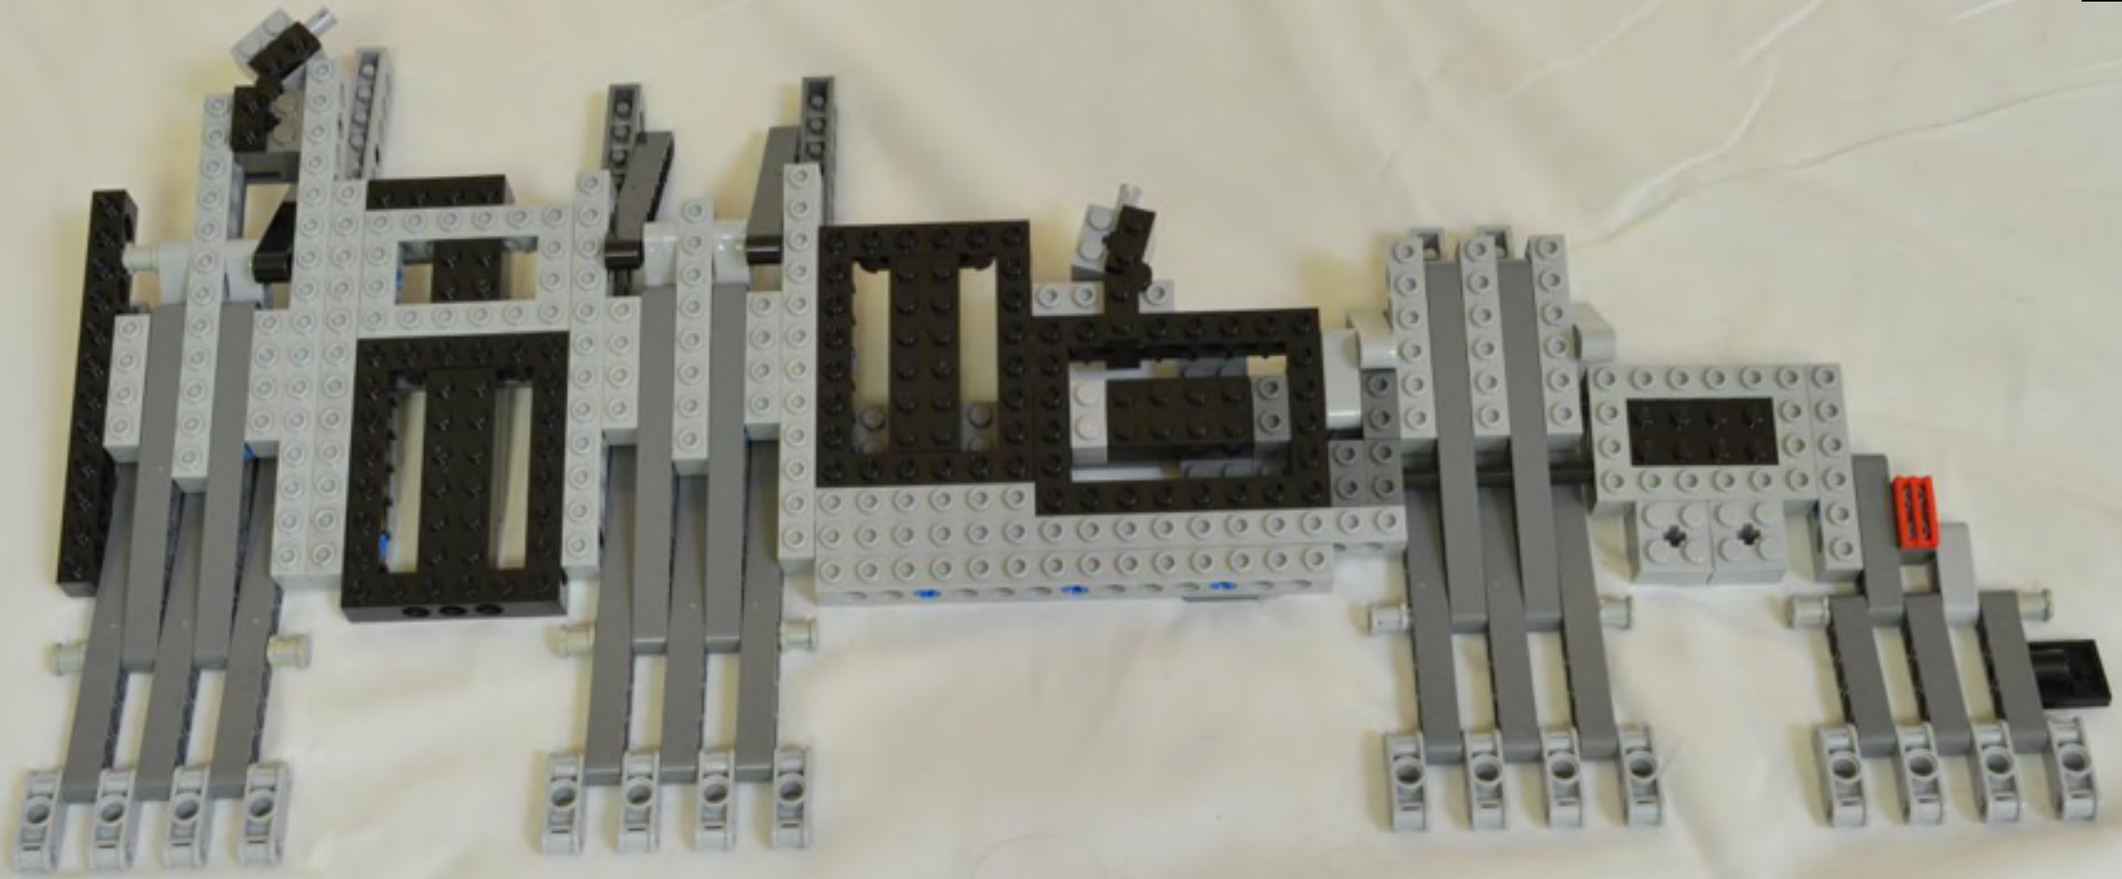


The front of the bow should be flush with the frame.
The studs on the black brick should be centered under this first hole in the technic brick.

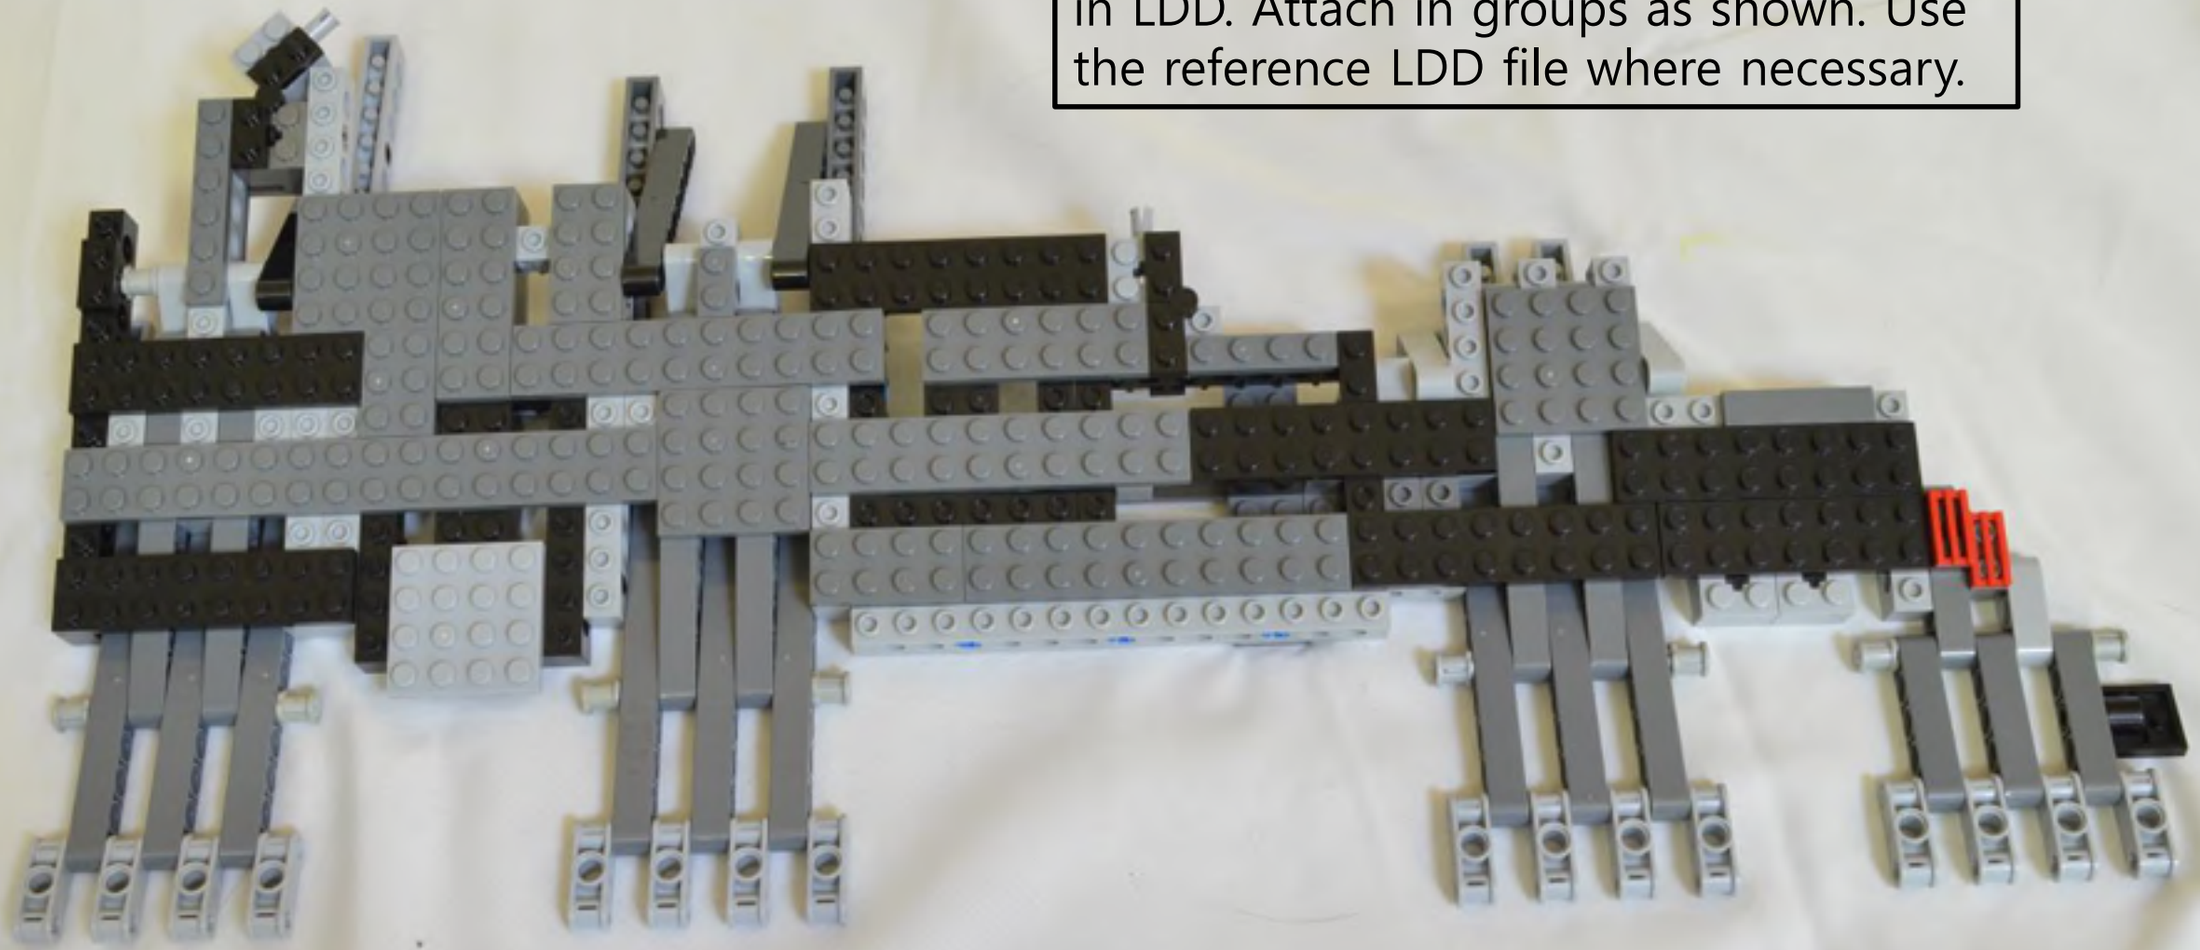




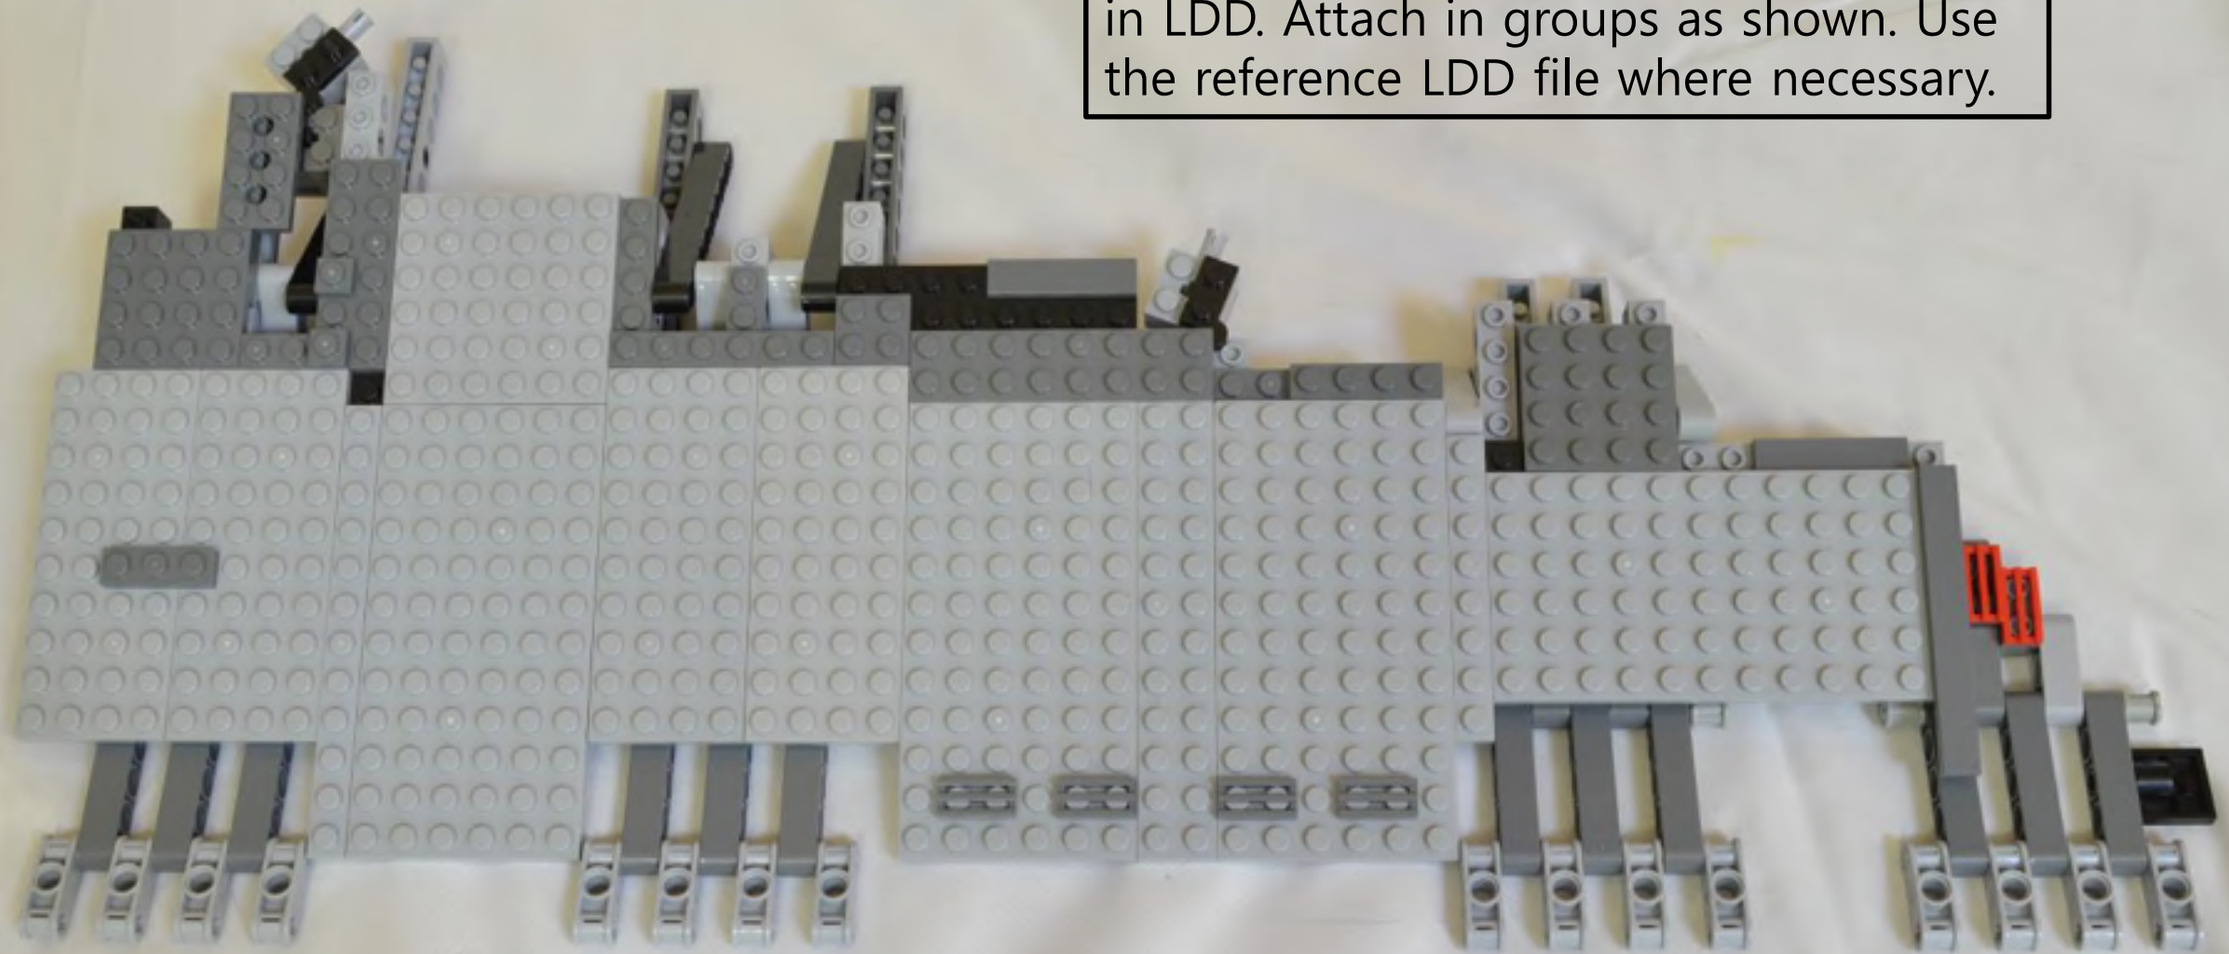




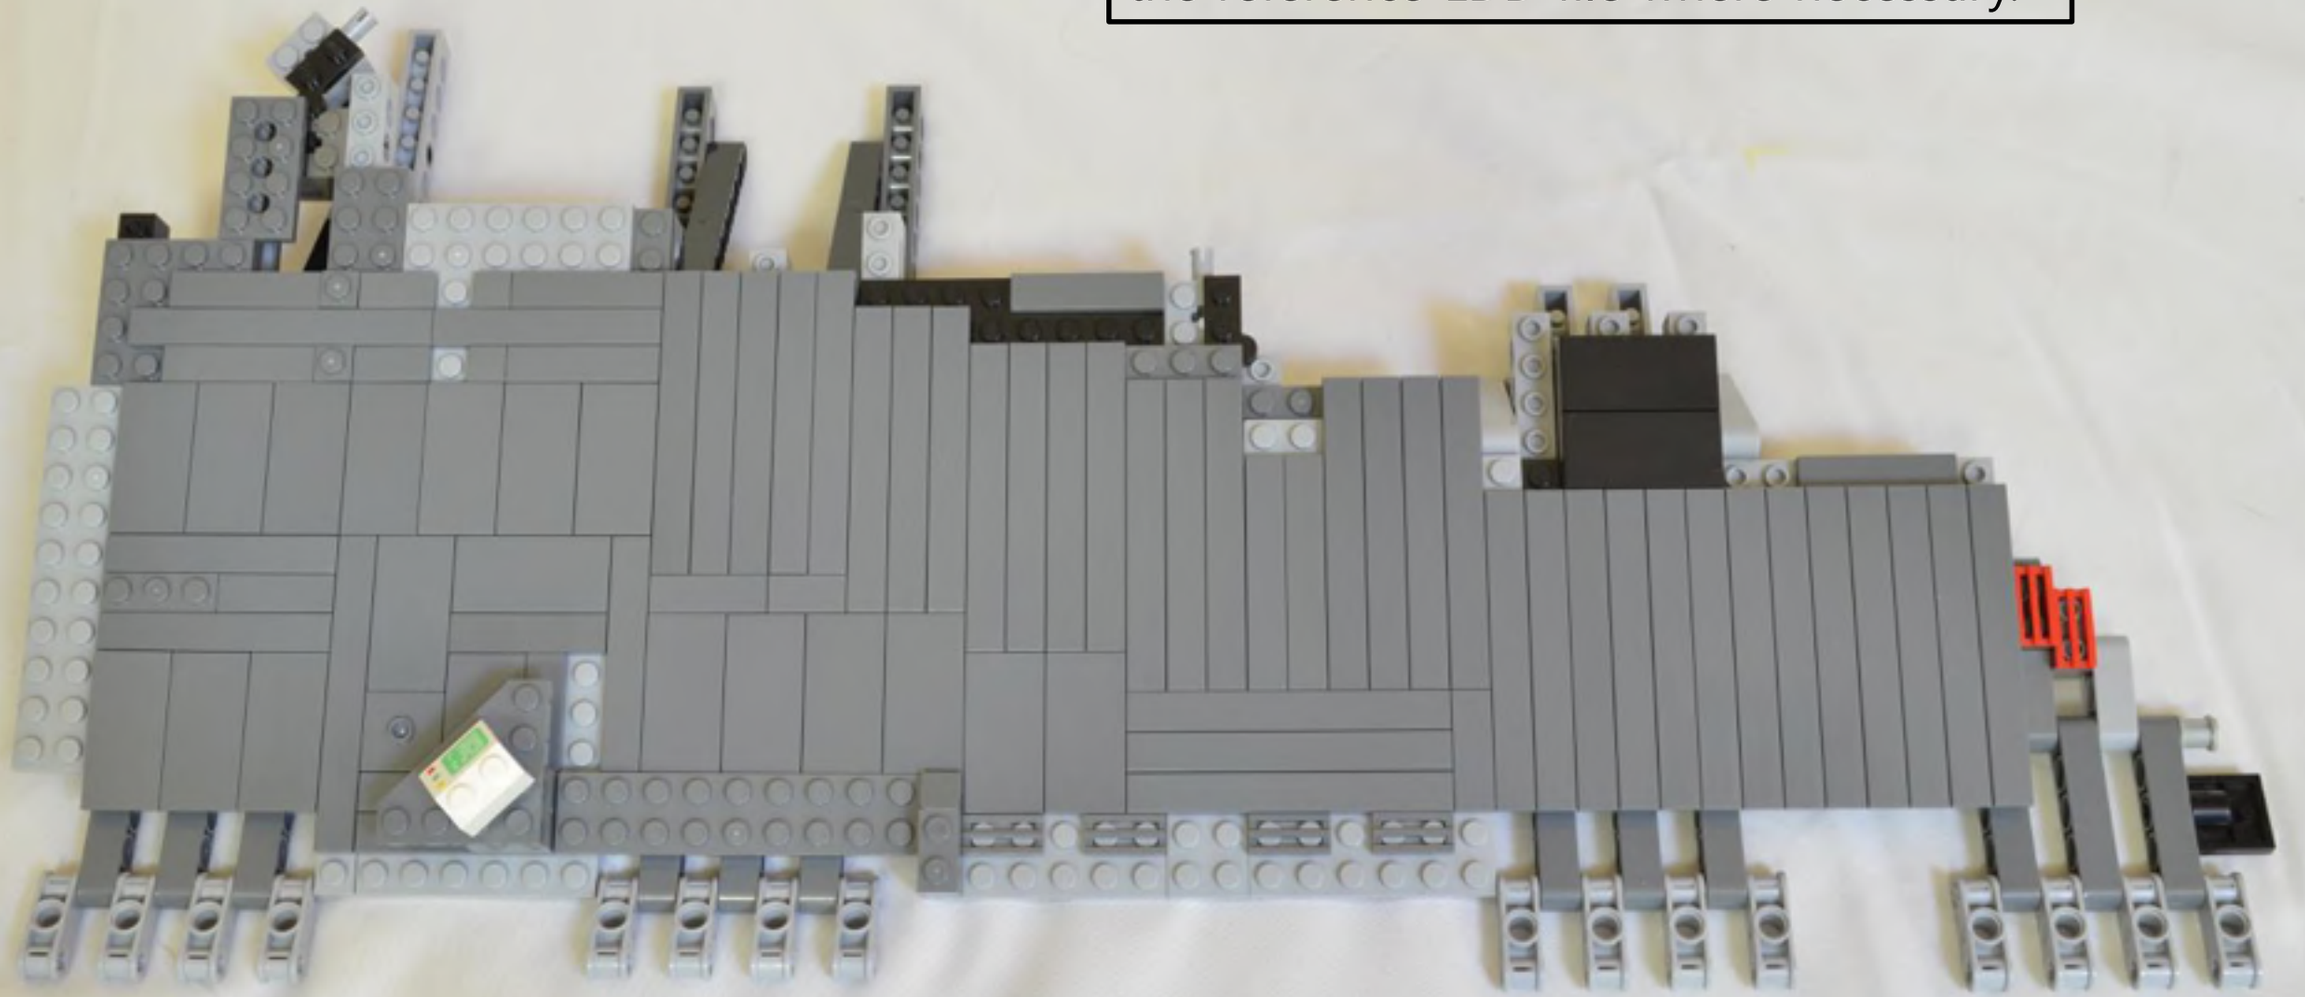
The plates have been ordered by layer in LDD. Attach in groups as shown. Use the reference LDD file where necessary.

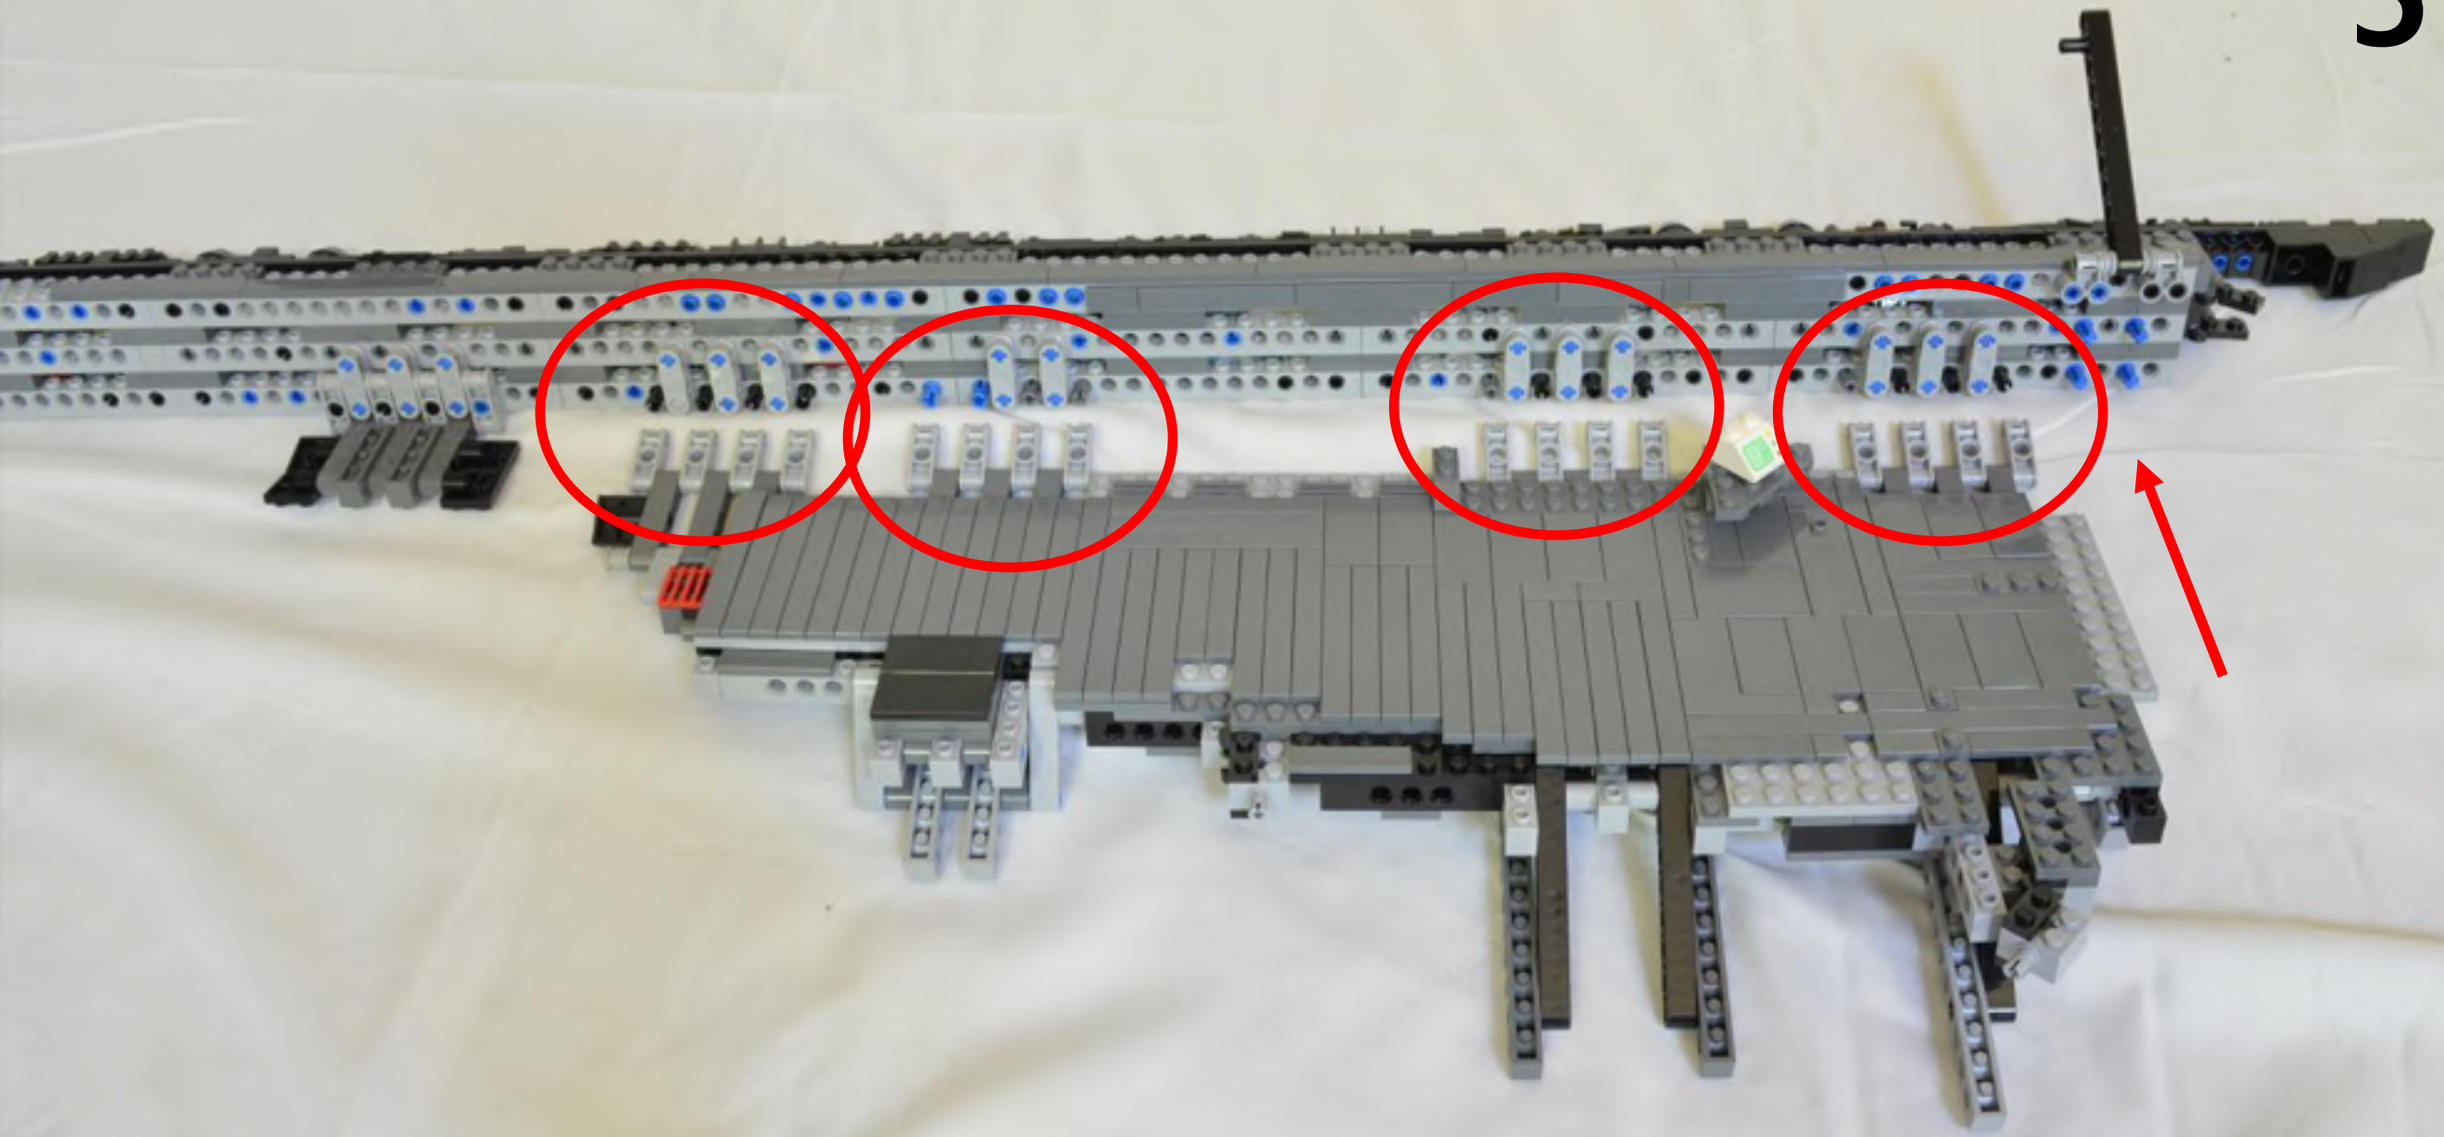


The plates have been ordered by layer in LDD. Attach in groups as shown. Use the reference LDD file where necessary.

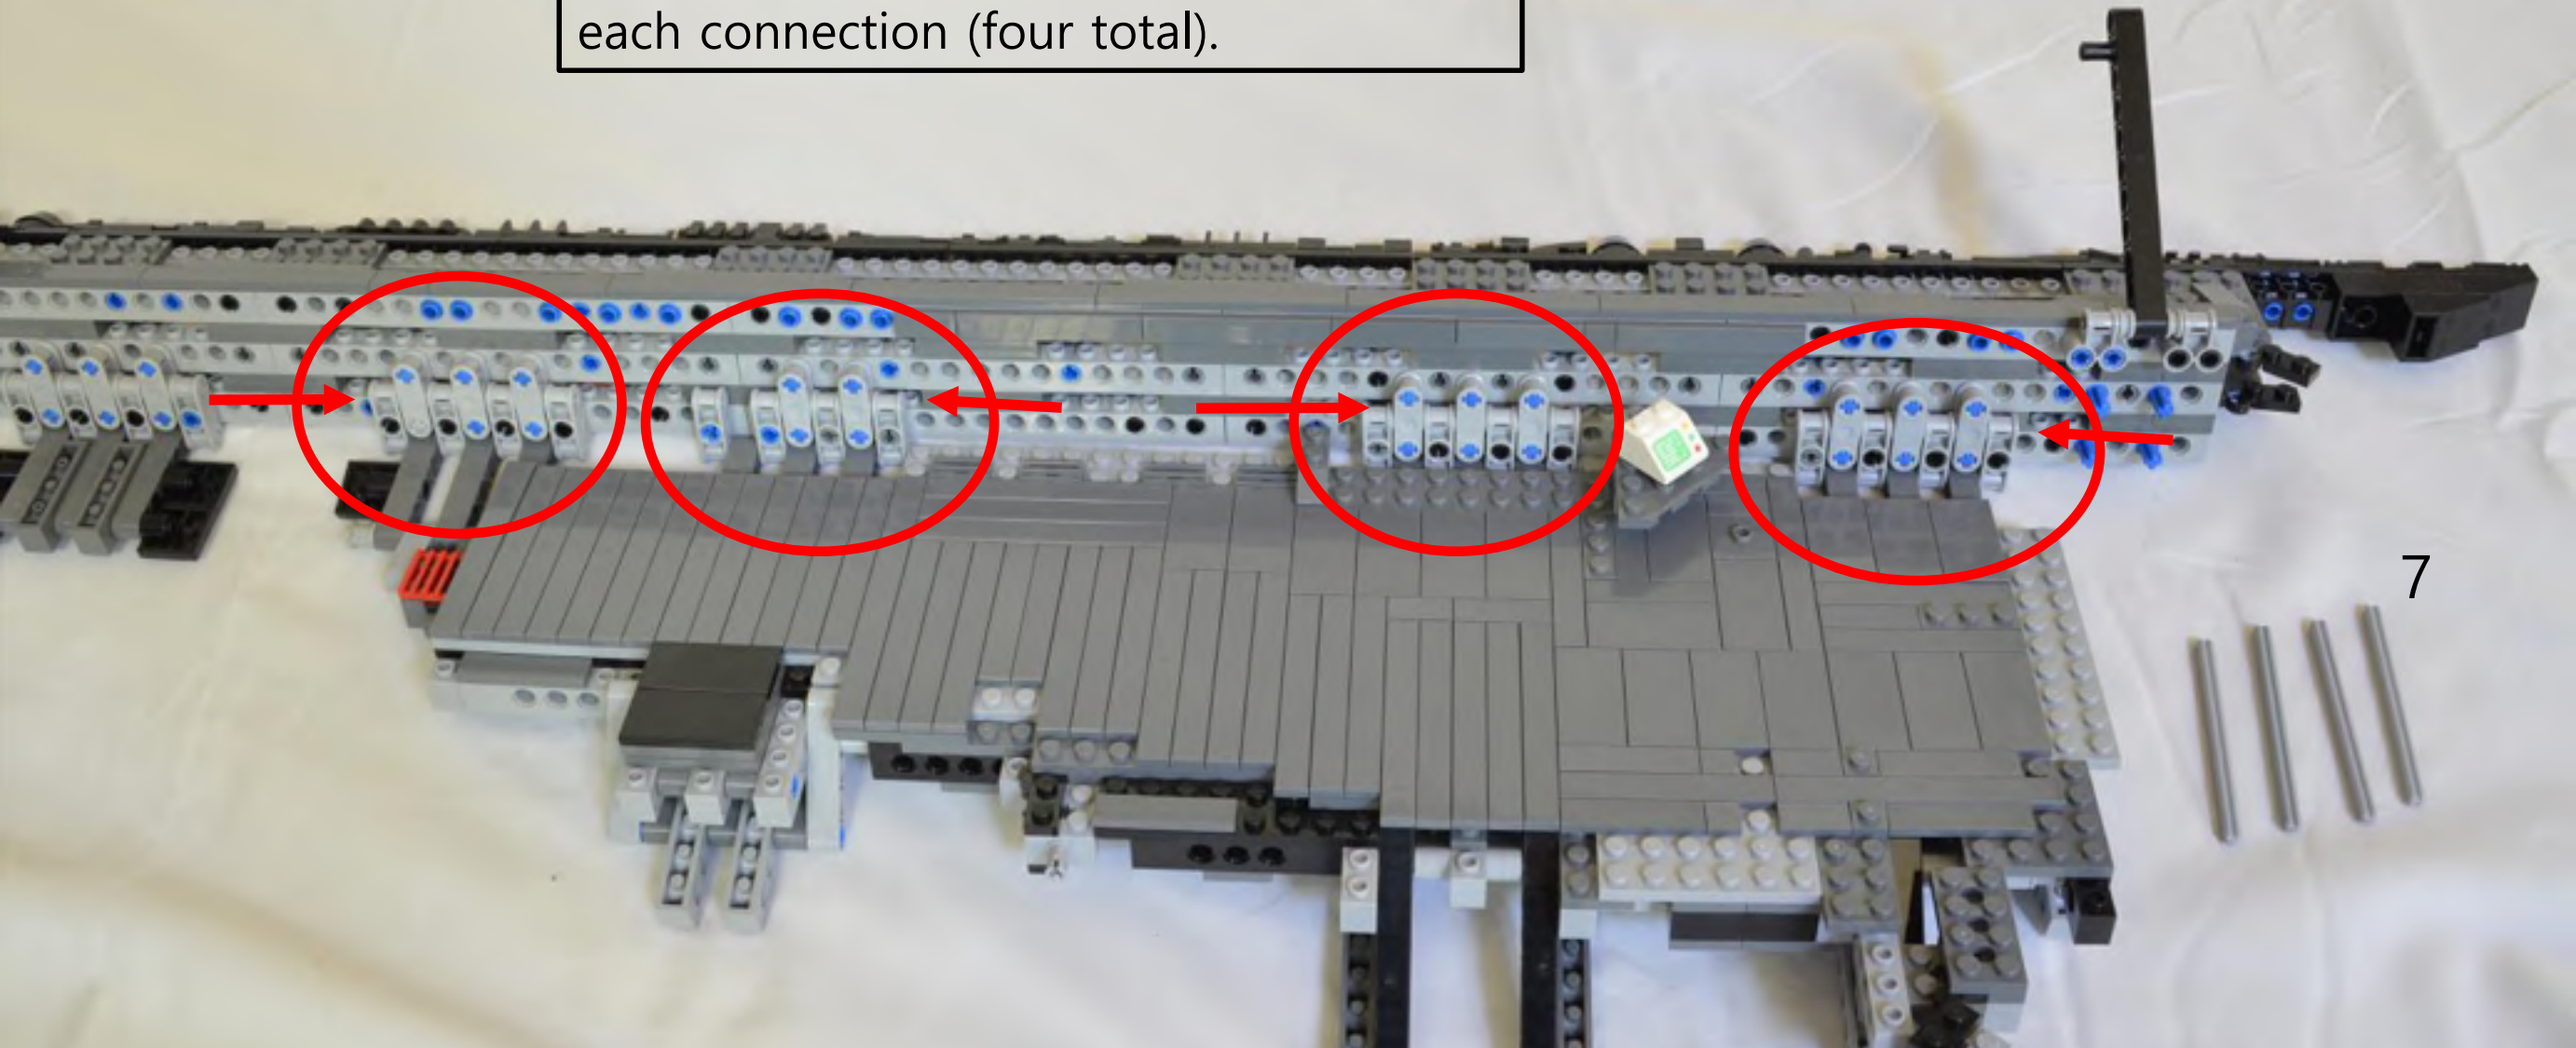


The plates have been ordered by layer in LDD. Attach in groups as shown. Use the reference LDD file where necessary.



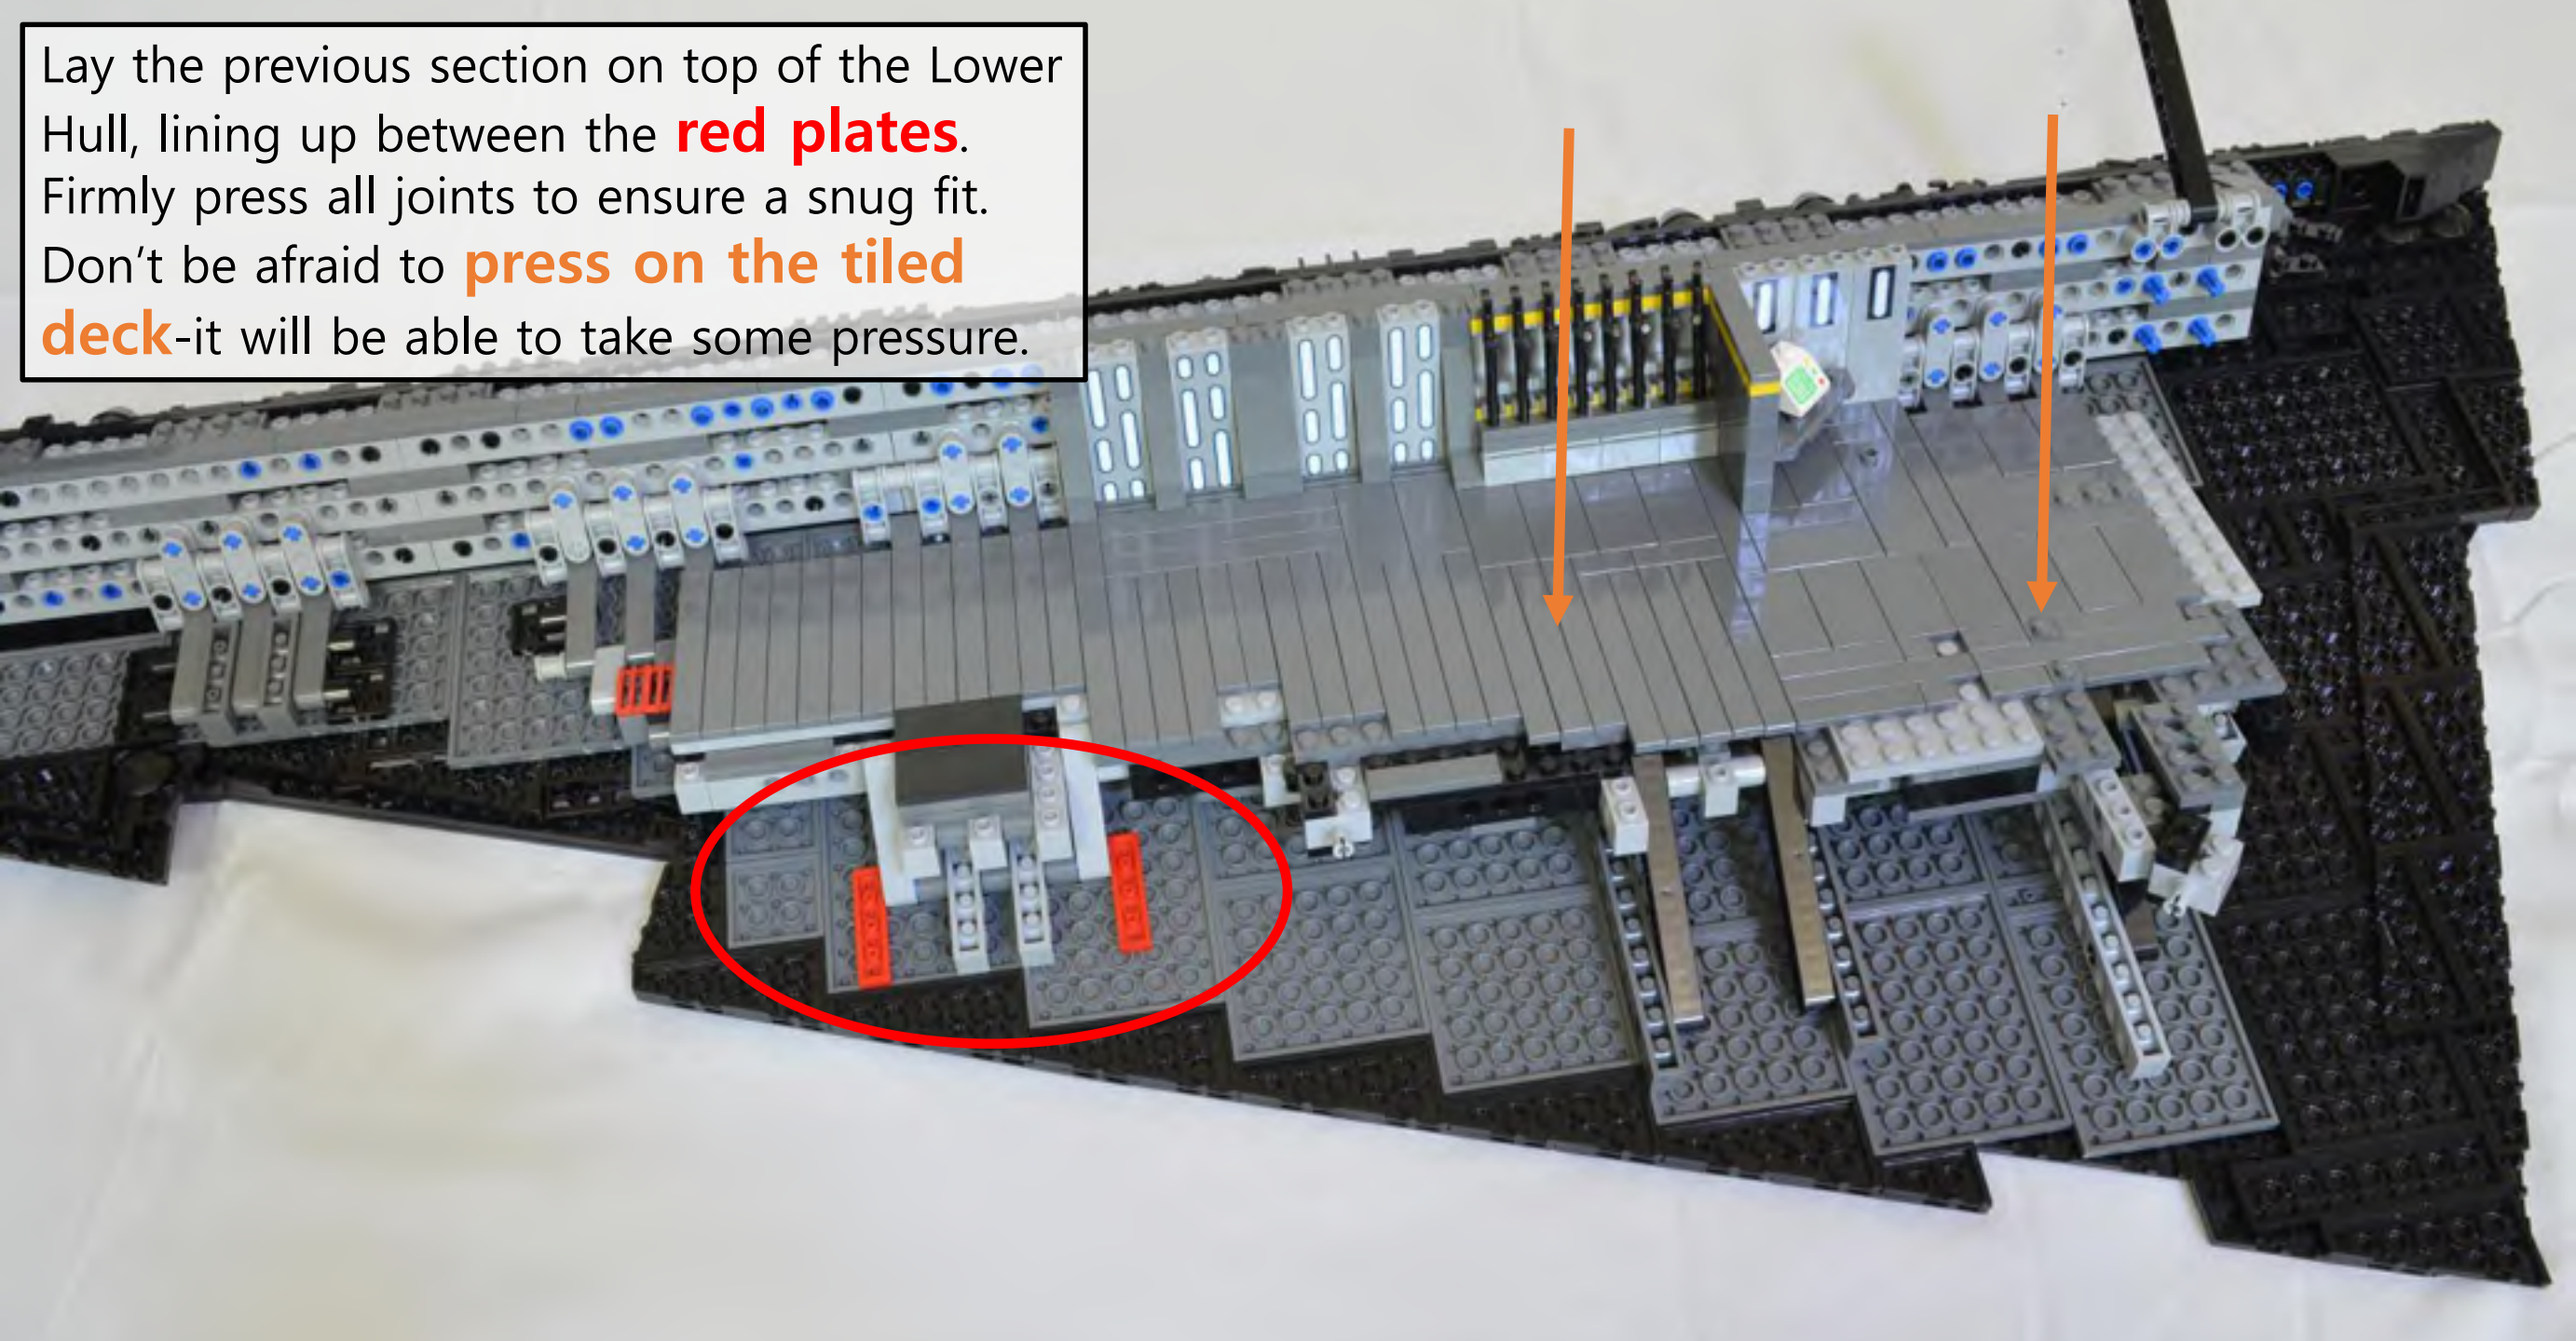


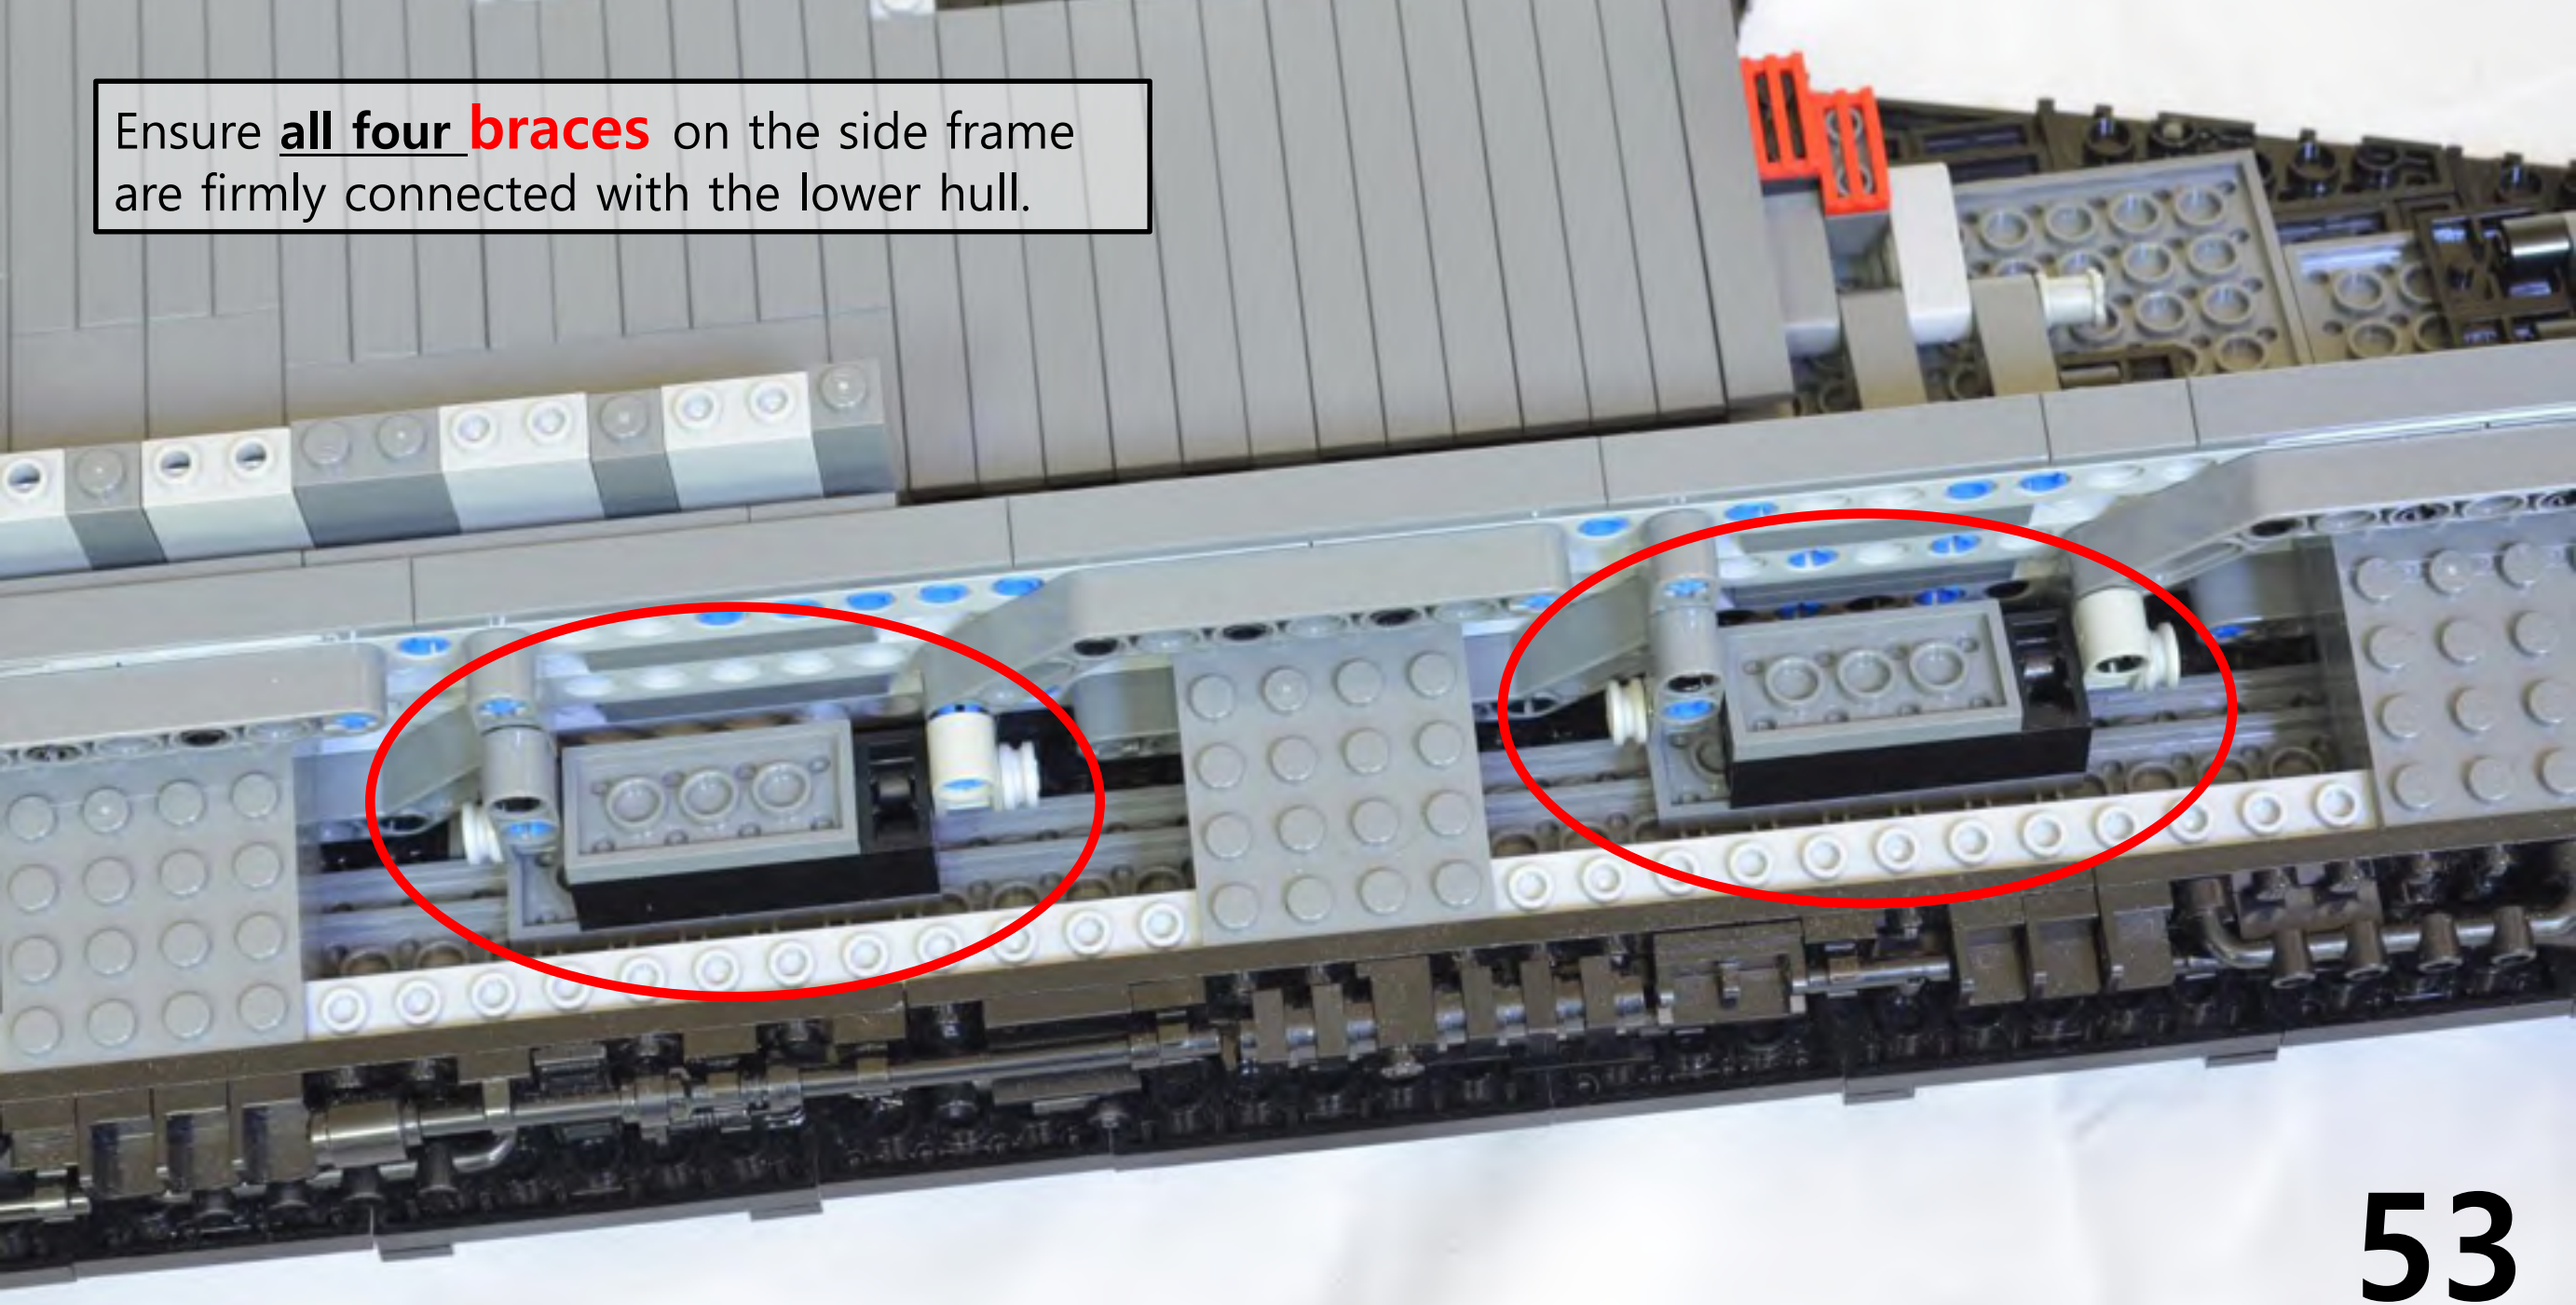
After attaching the inner frame to the side frame, slide a 7m technic axle into each connection (four total).



7

Lay the previous section on top of the Lower Hull, lining up between the **red plates**.
Firmly press all joints to ensure a snug fit.
Don't be afraid to **press on the tiled deck**-it will be able to take some pressure.





Ensure **all four braces** on the side frame are firmly connected with the lower hull.

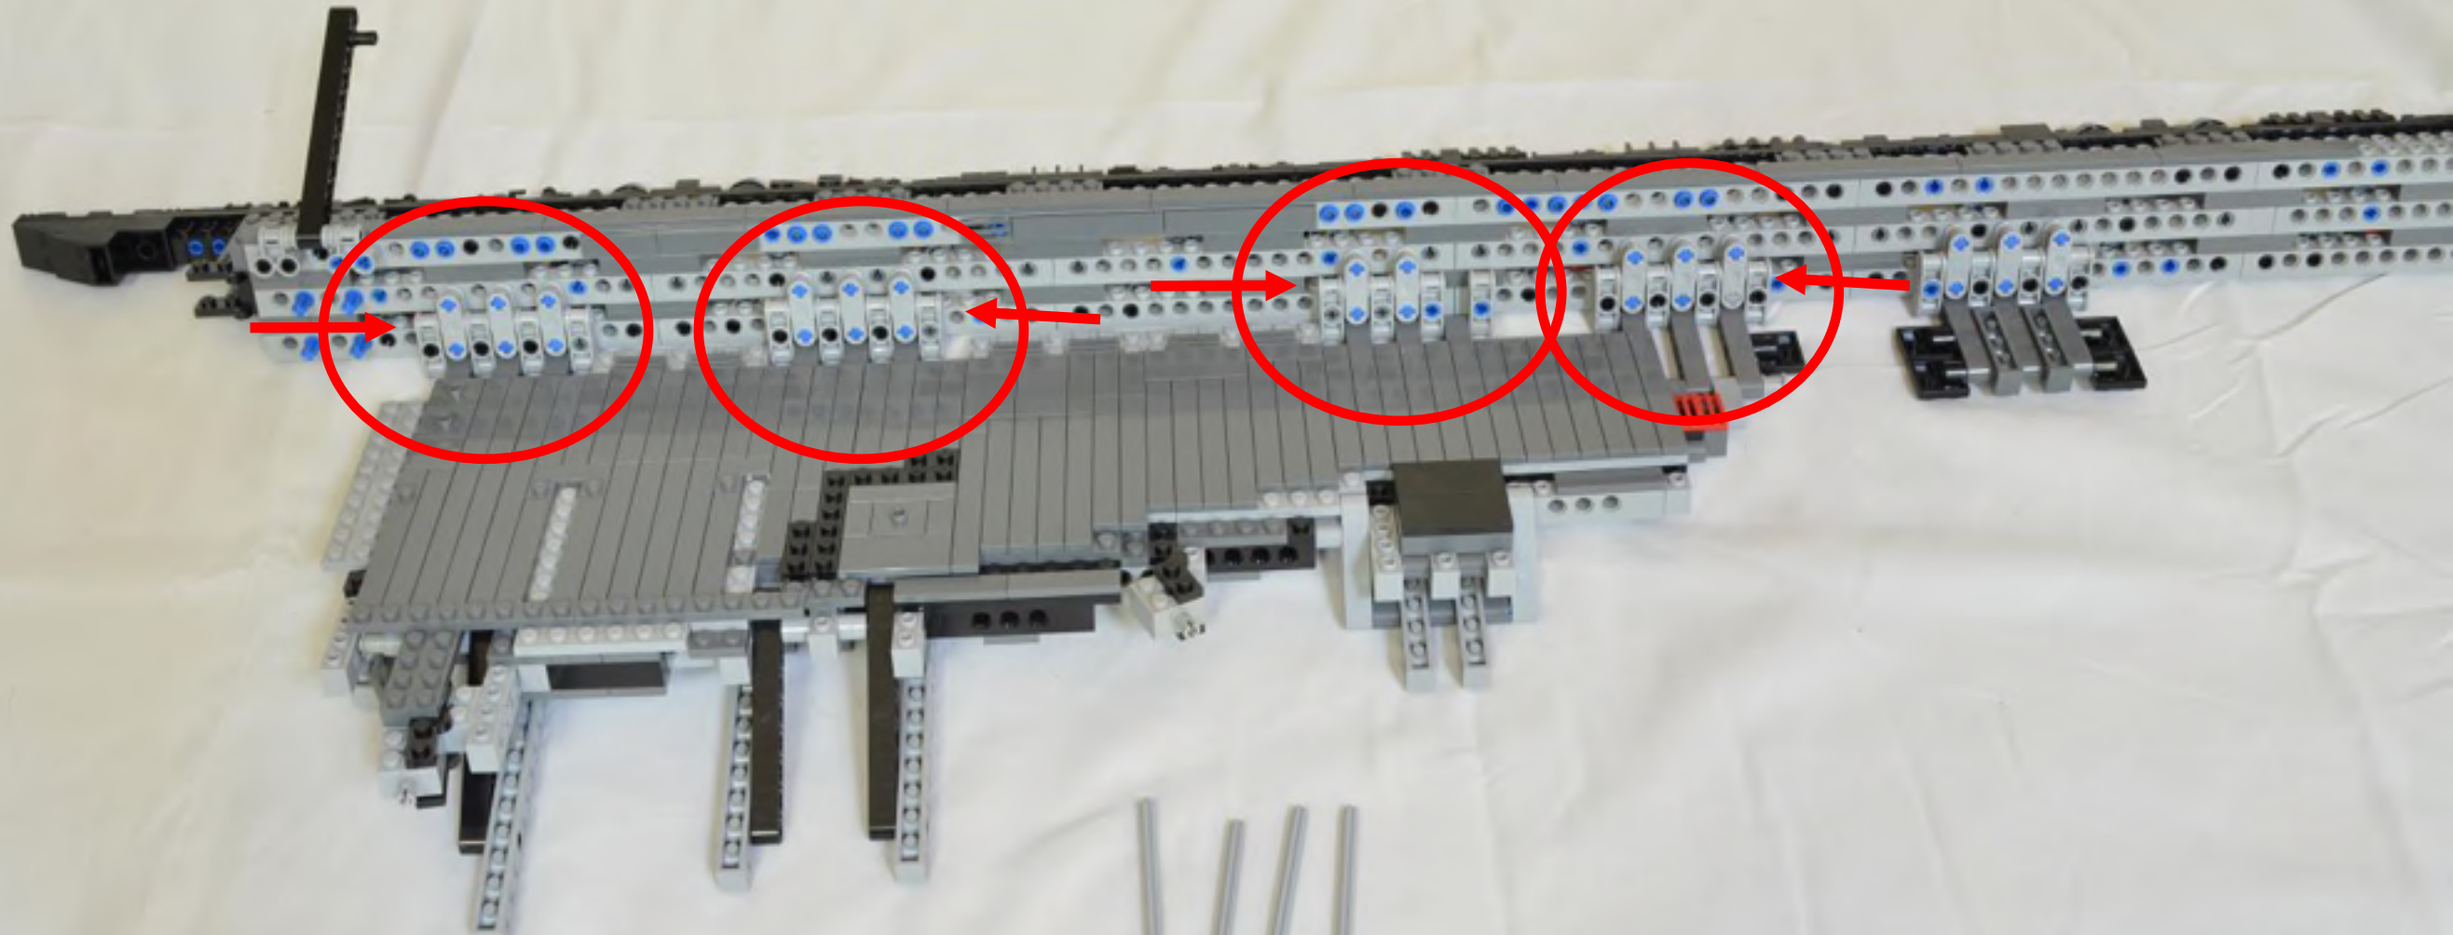
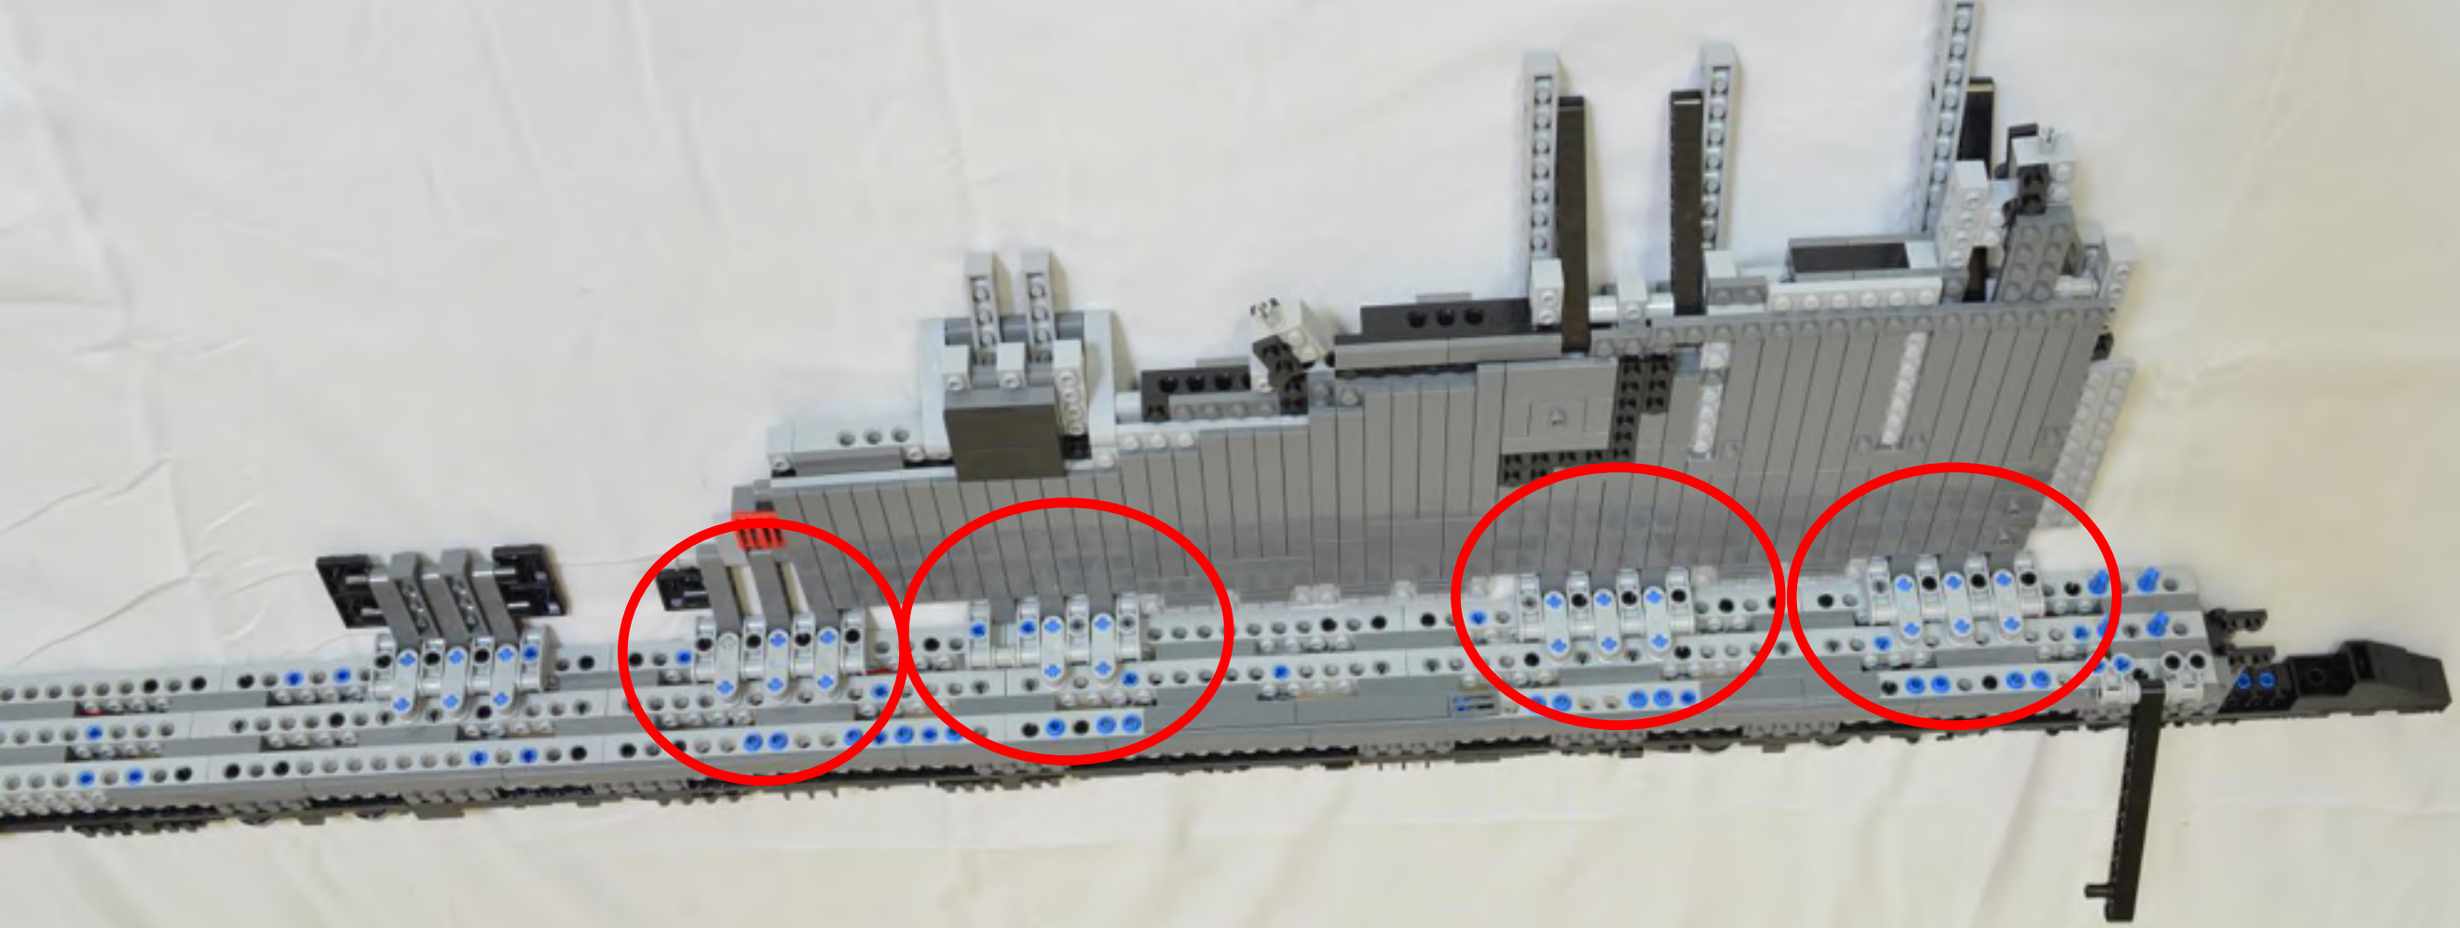
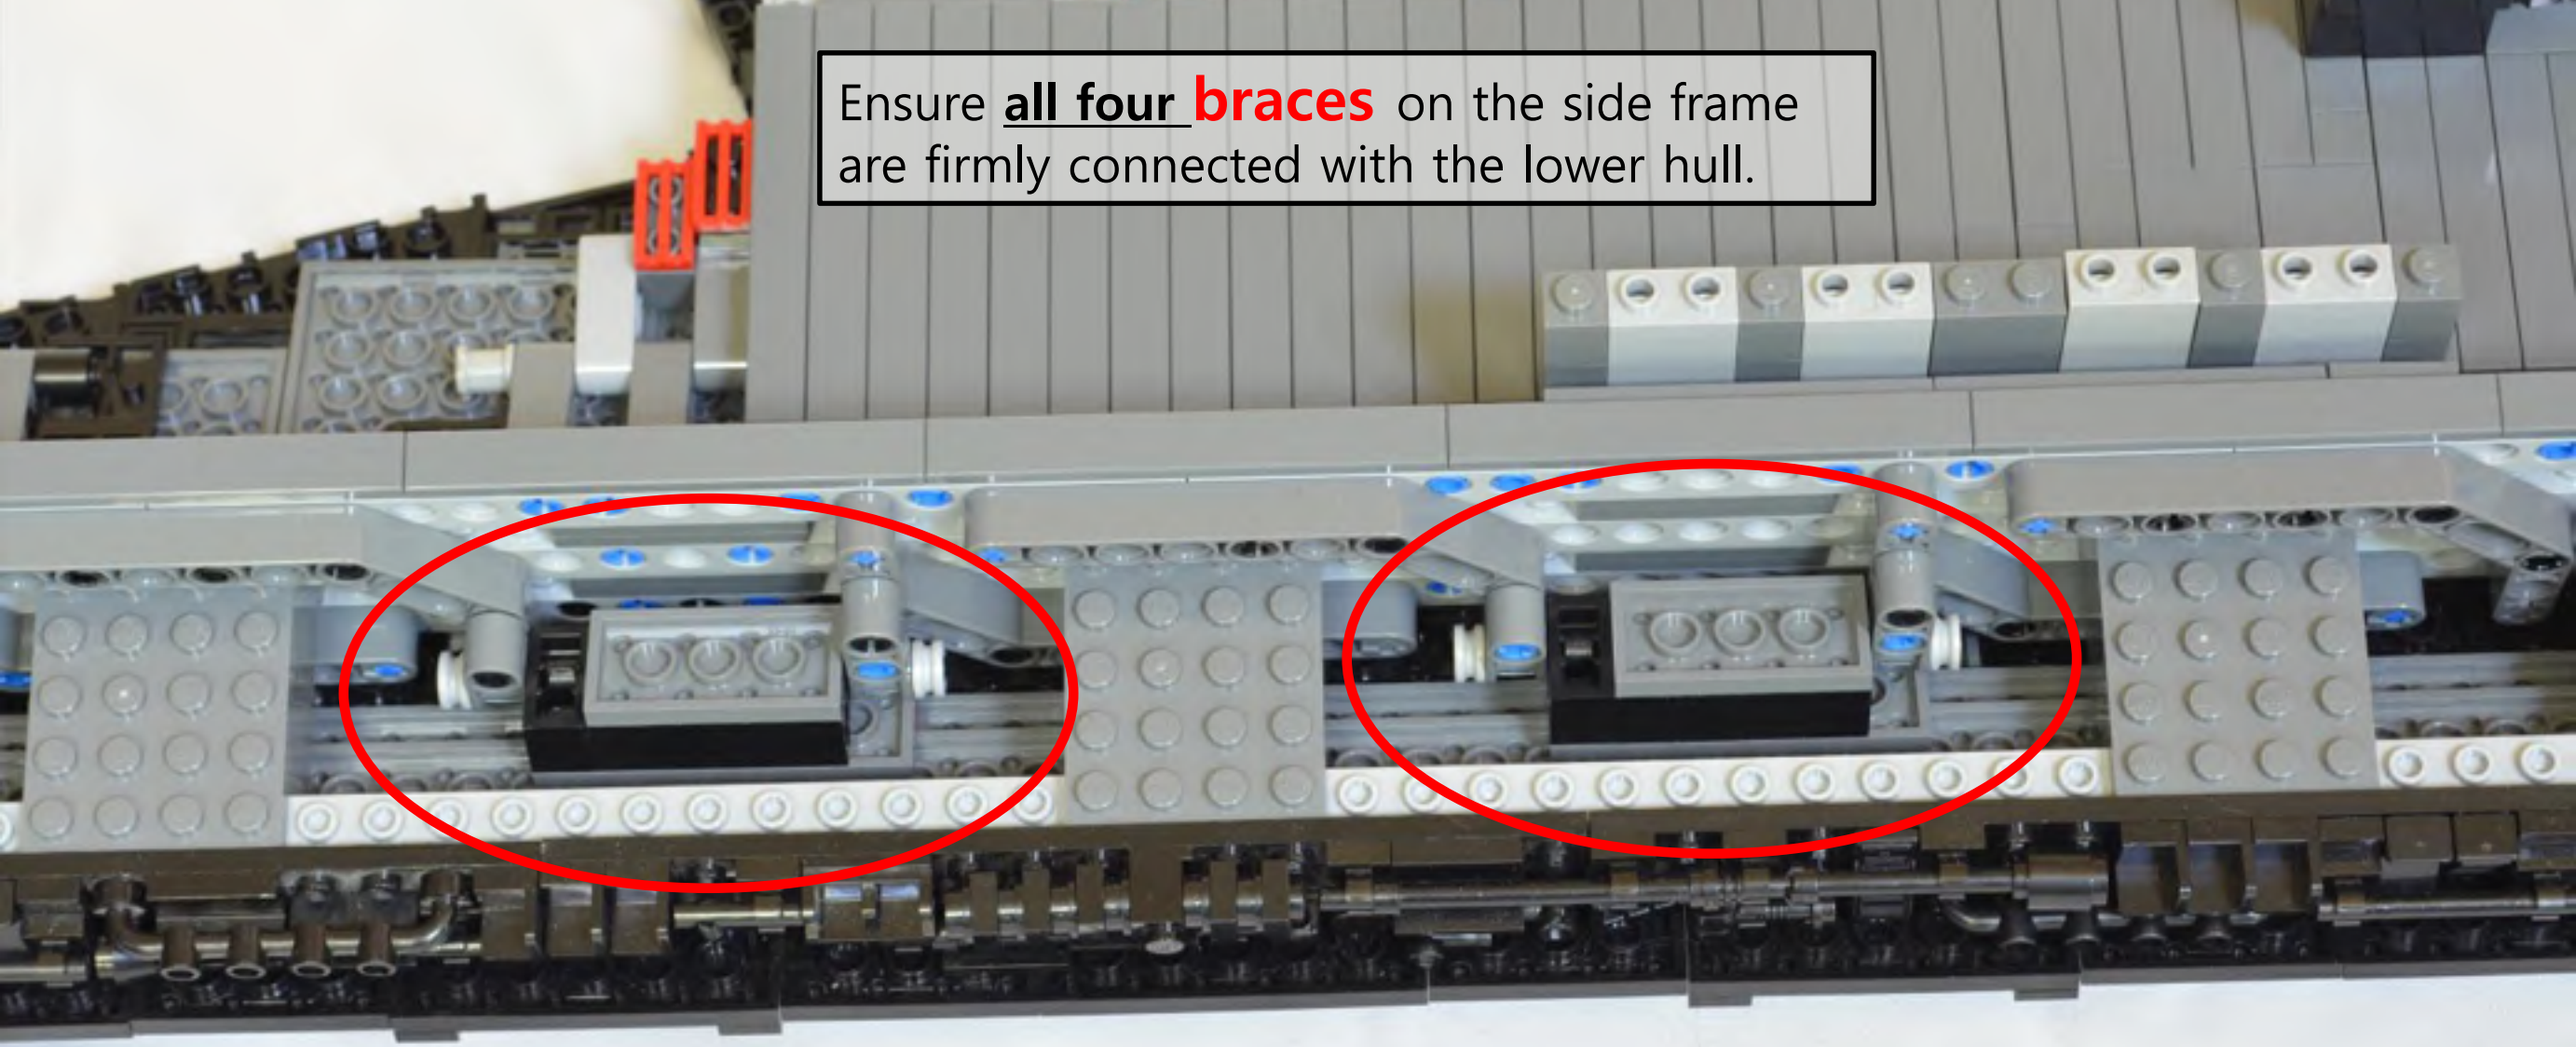
After attaching the inner frame to the side frame, slide a 7m technic axle into each connection (four total).





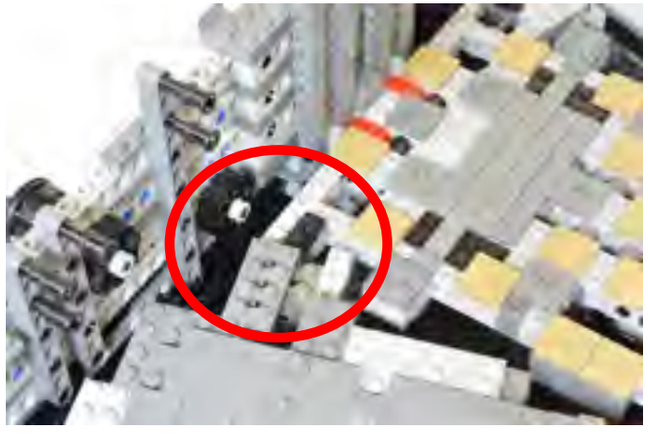
Lay the previous section on top of the Lower Hull, lining up between the **red plates**. Firmly press all joints to ensure a snug fit. Don't be afraid to **press on the tiled deck**-it will be able to take some pressure.



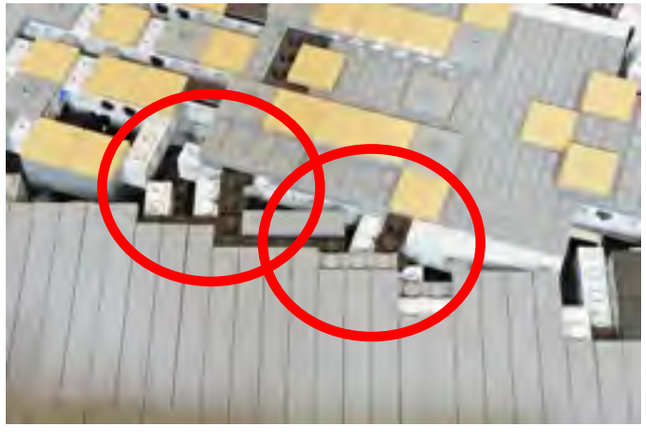
Ensure **all four** **braces** on the side frame
are firmly connected with the lower hull.

Here are the joints to connect the side frames:

Middle technic joint



Middle technic joints

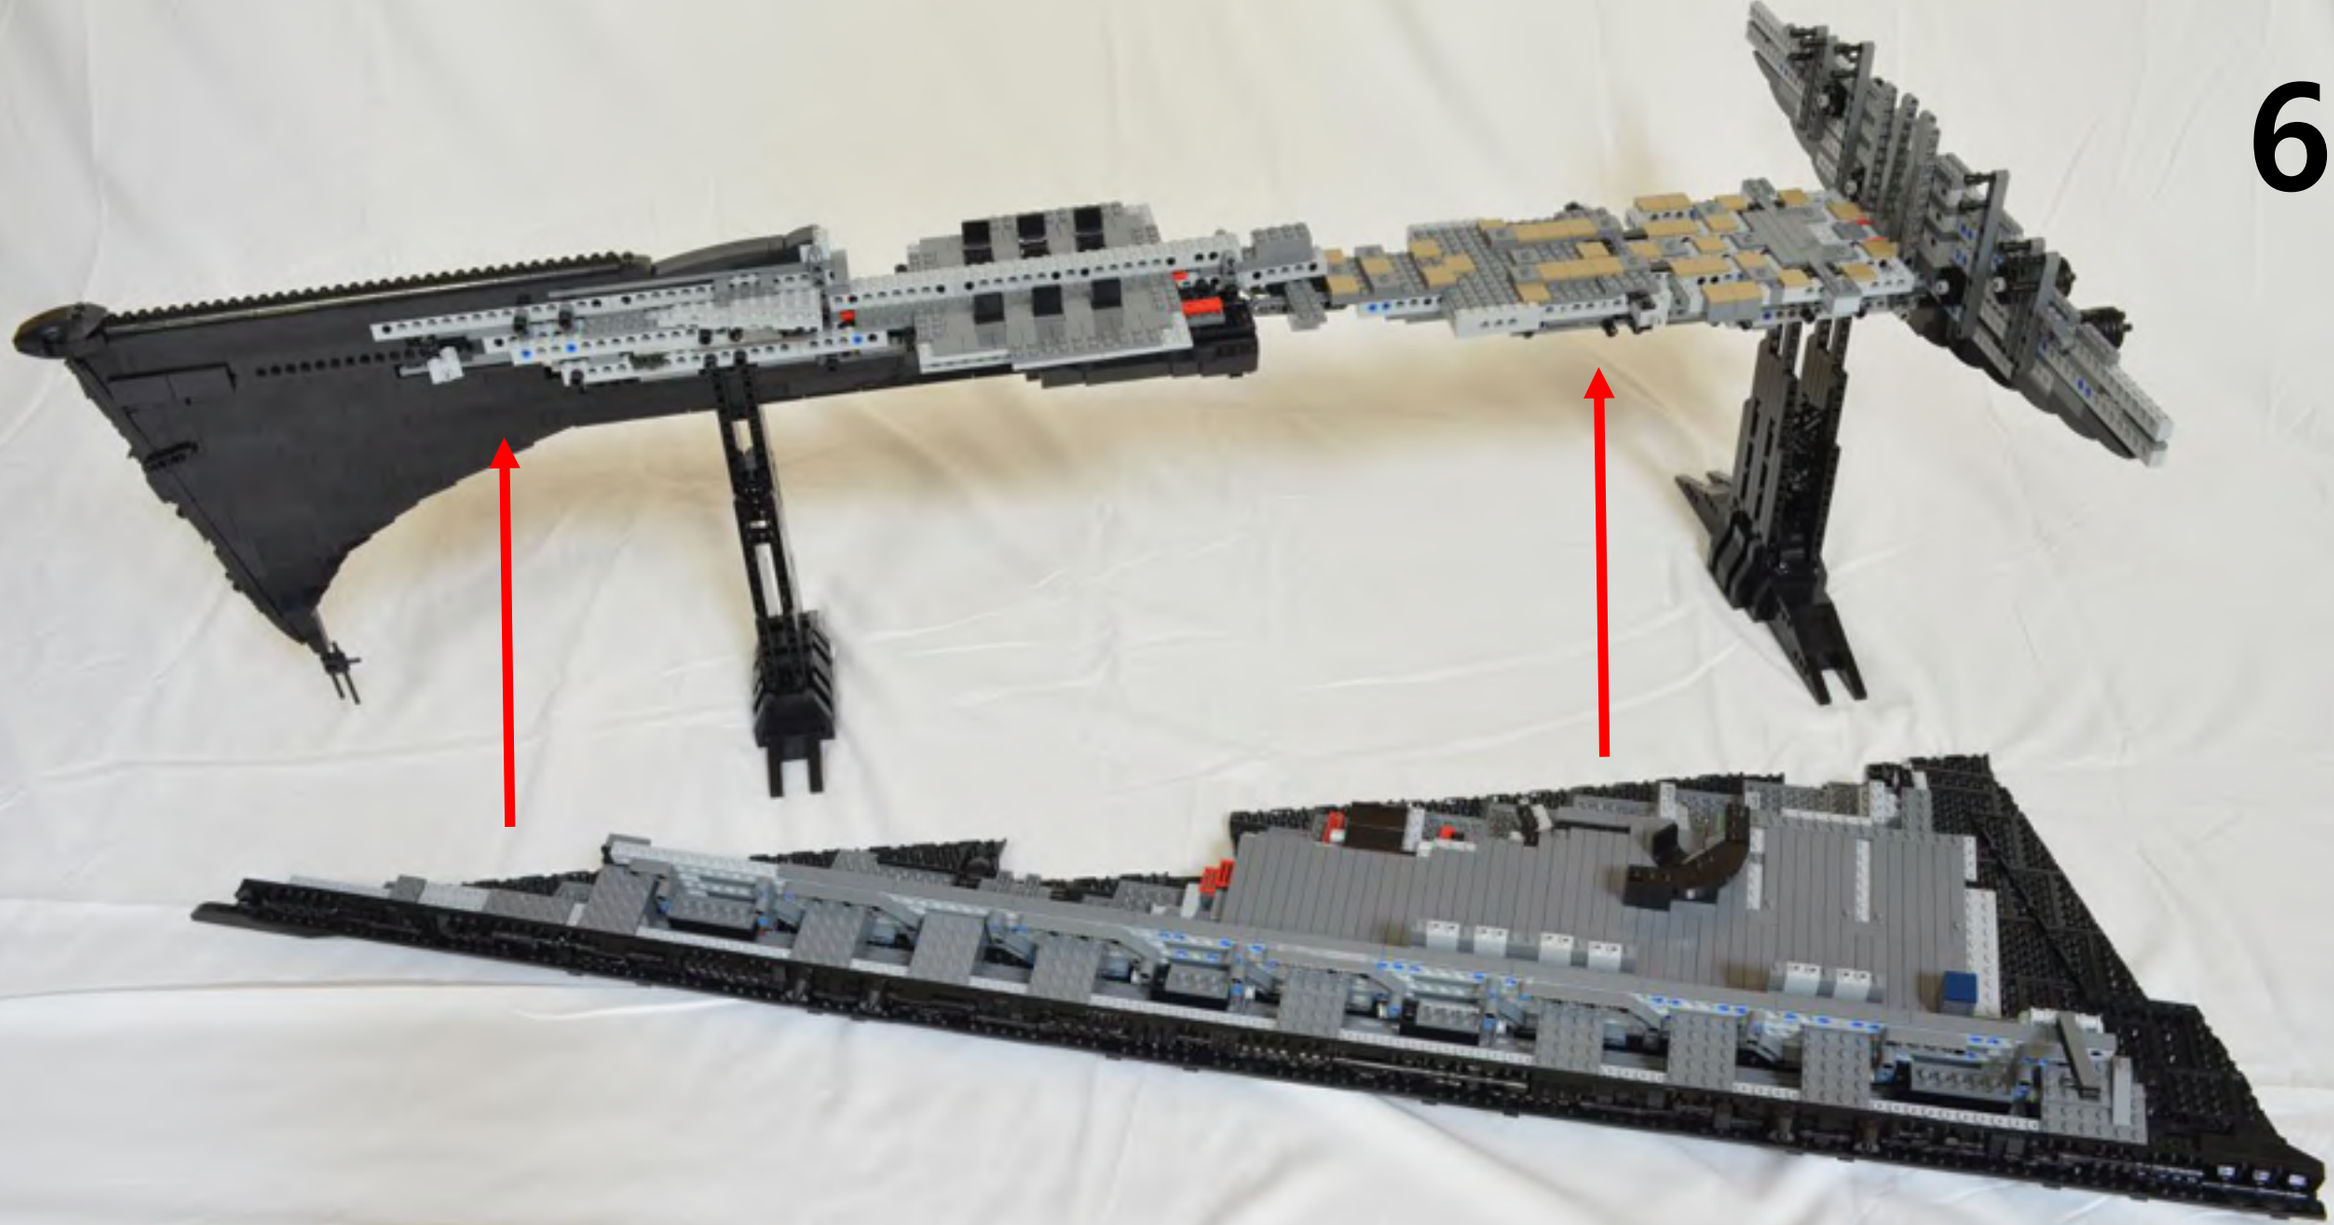


Front technic joint

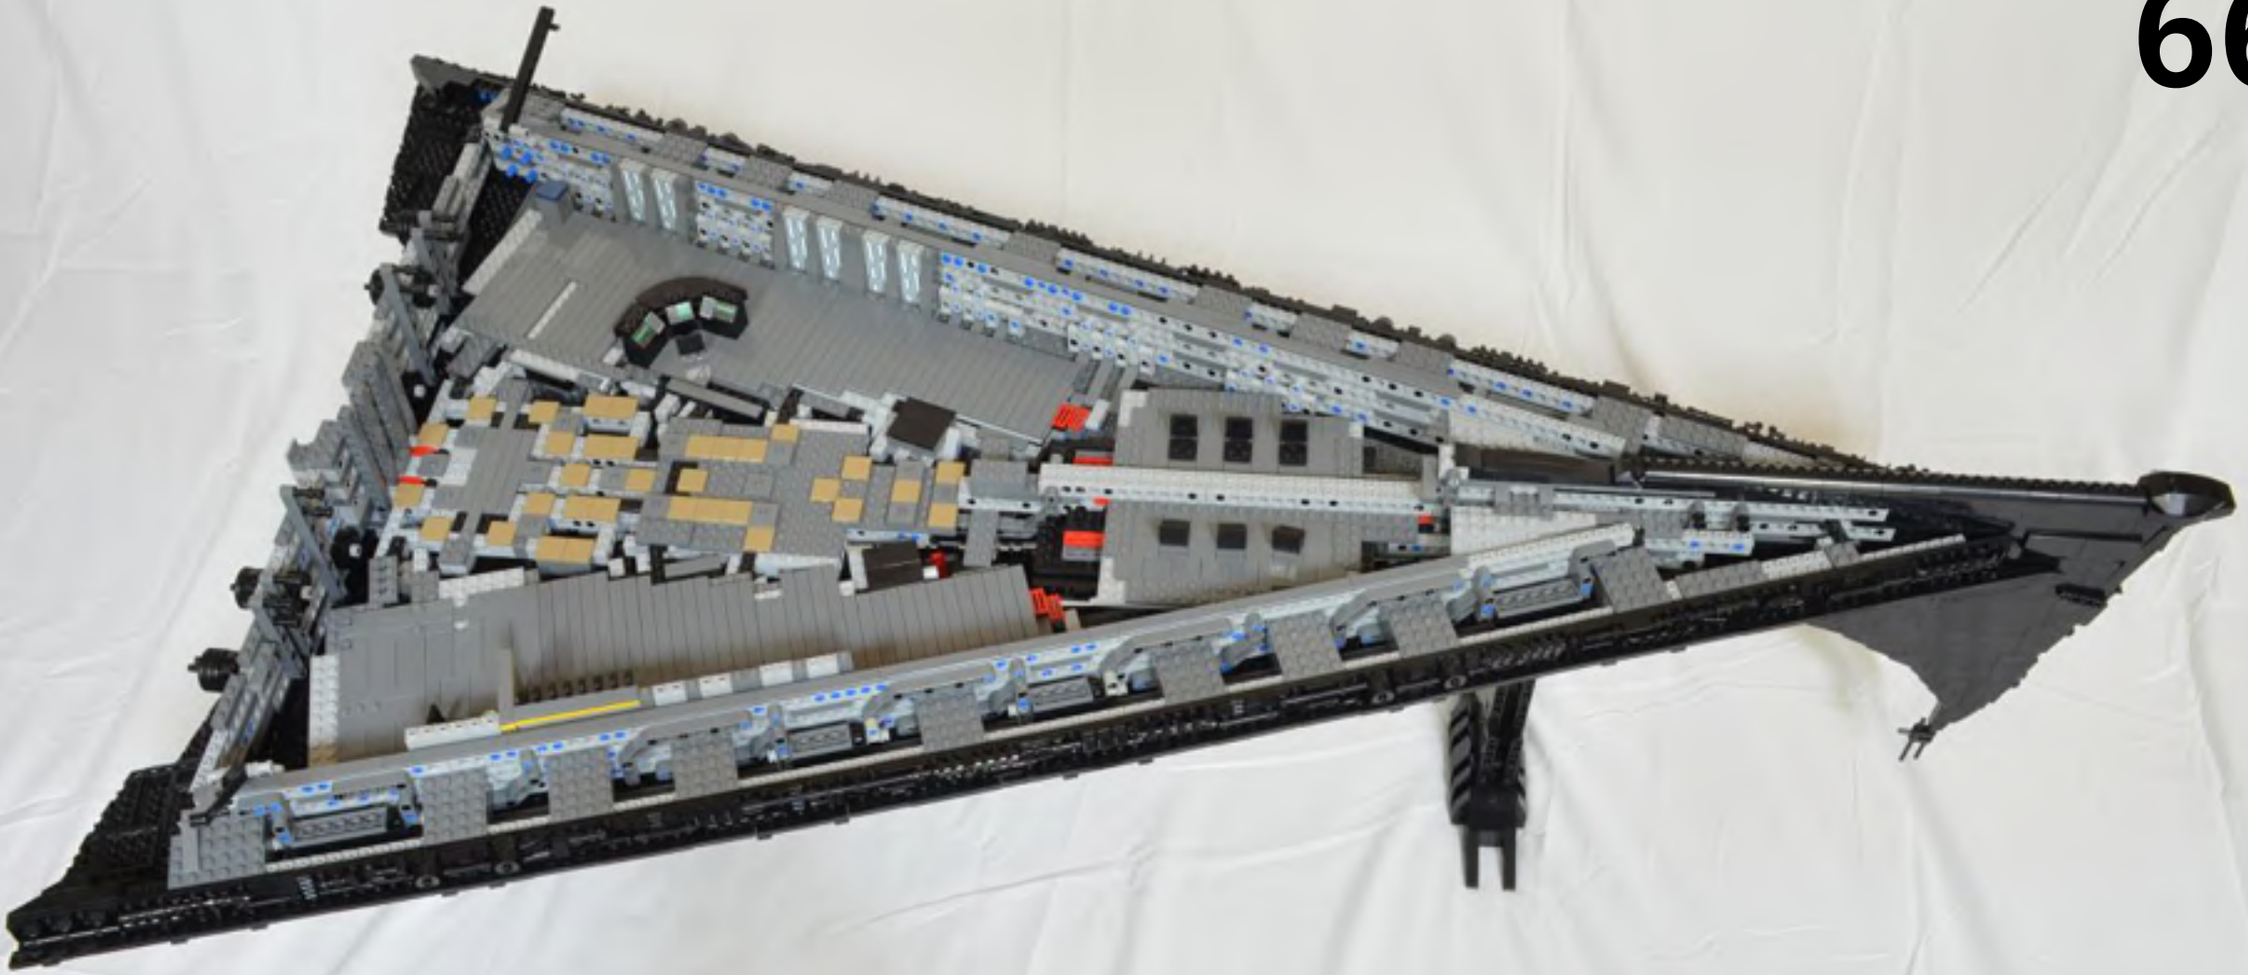
Front hinge joint

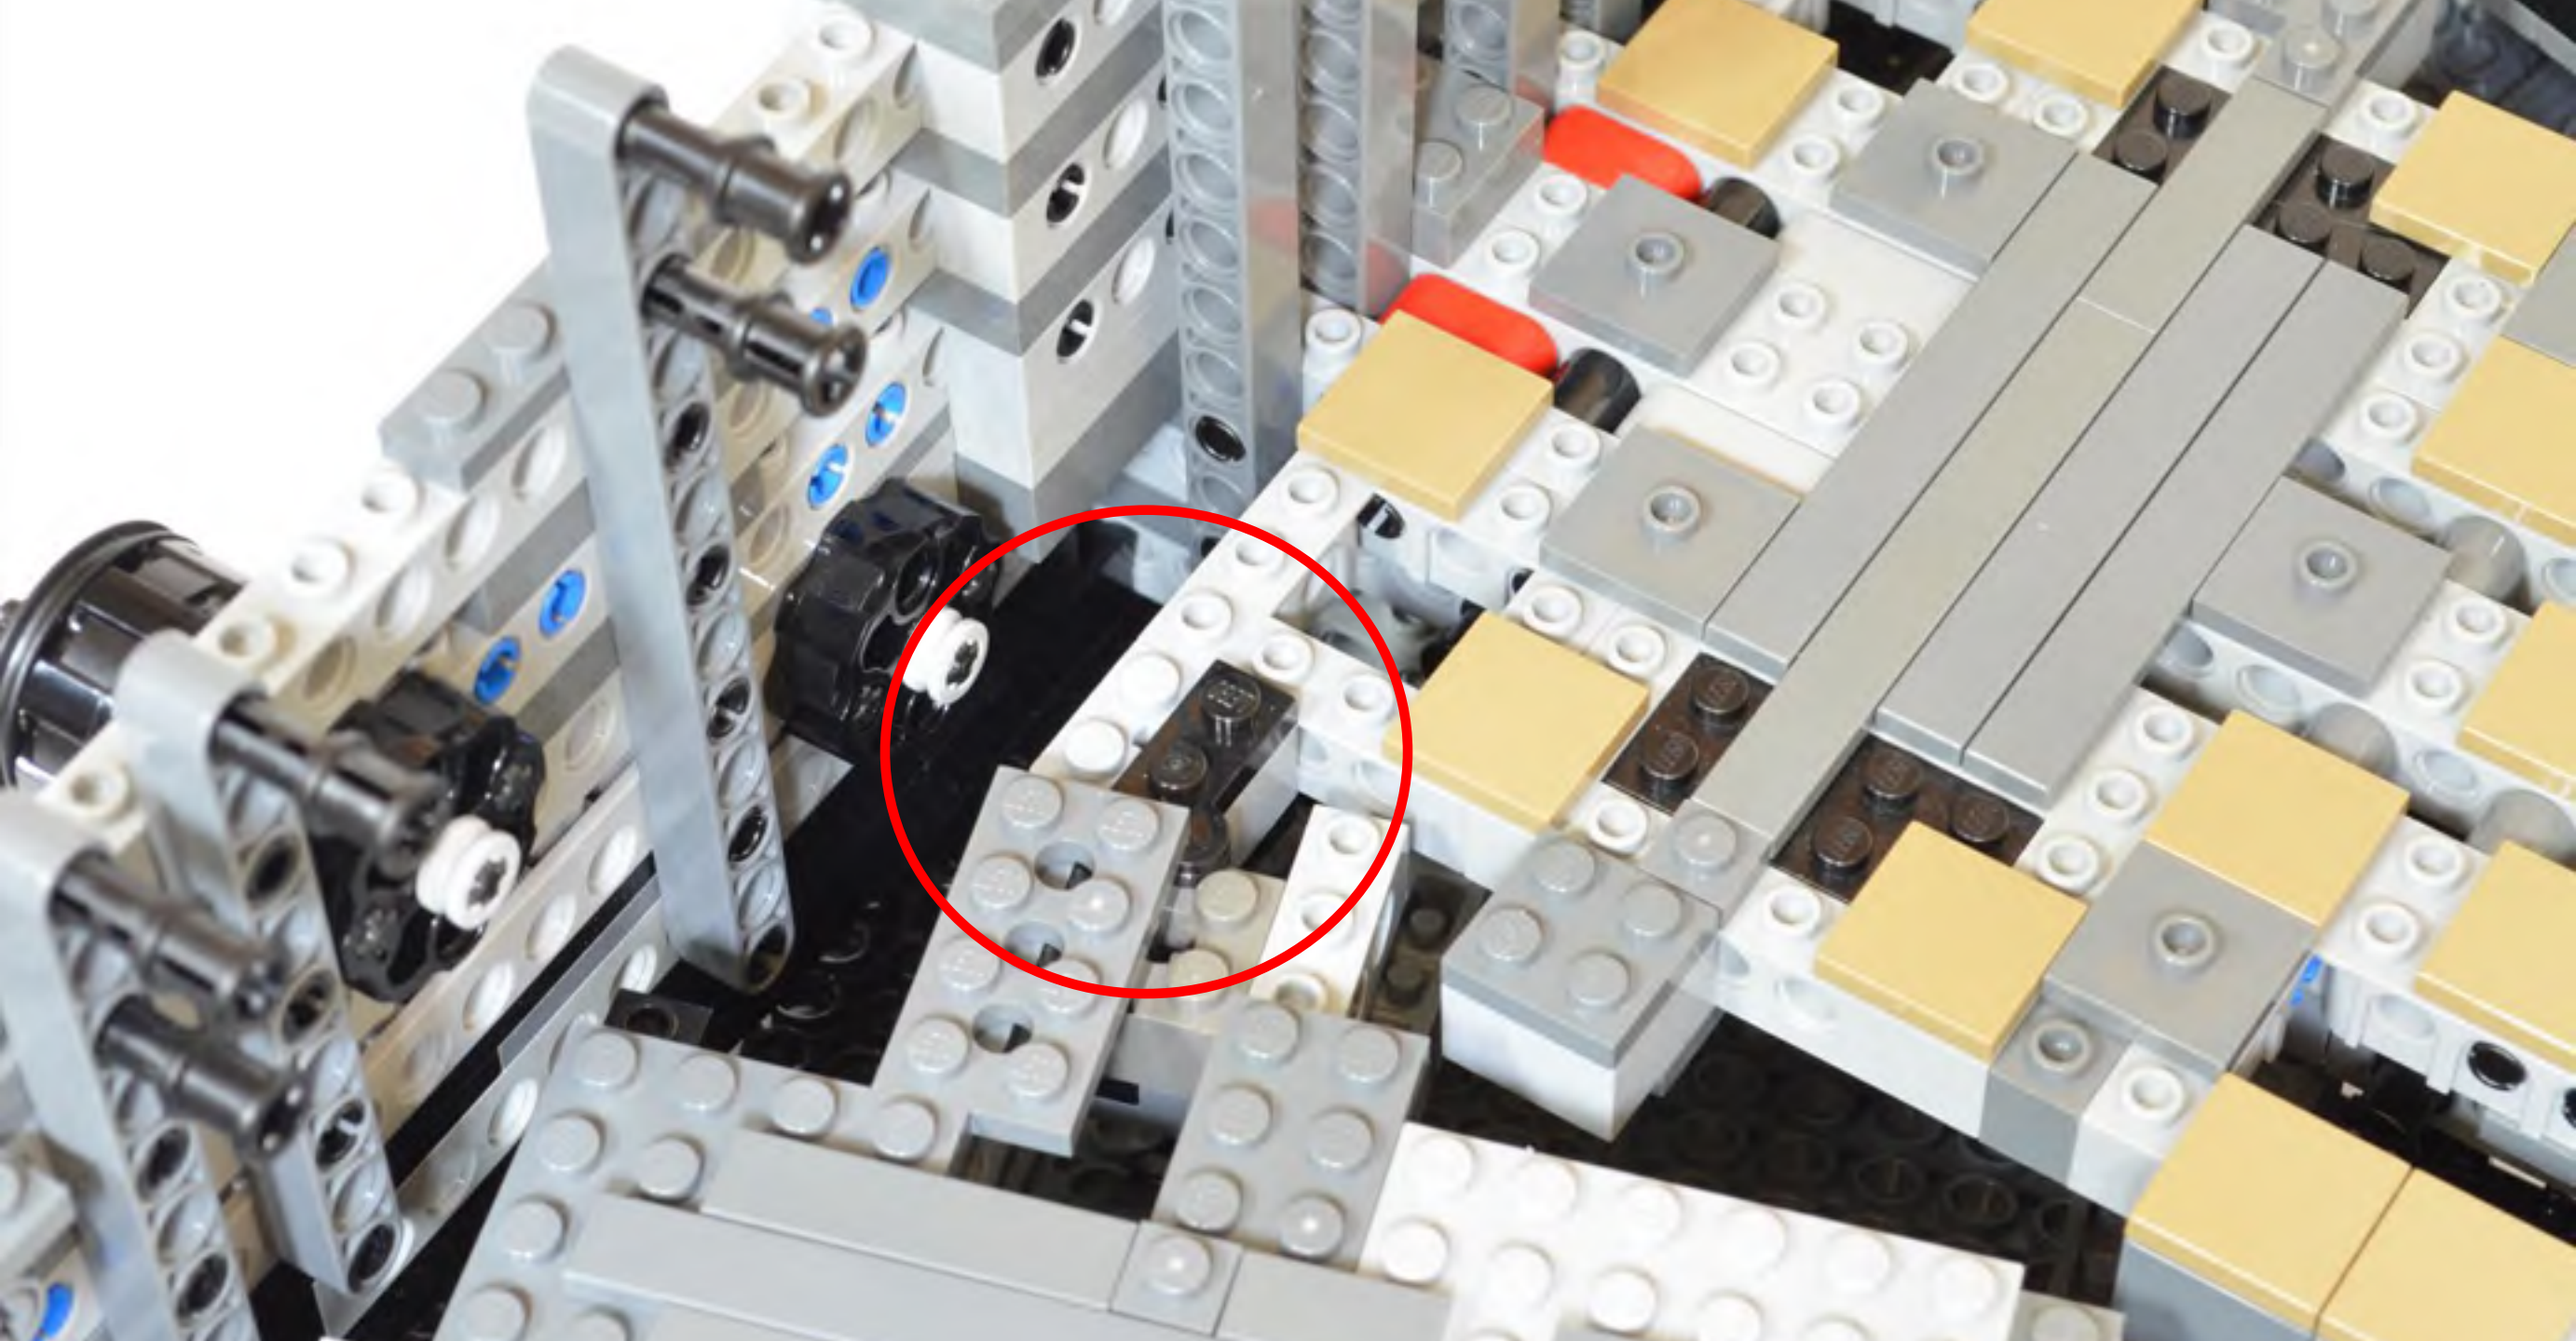
Add tile overtop joint

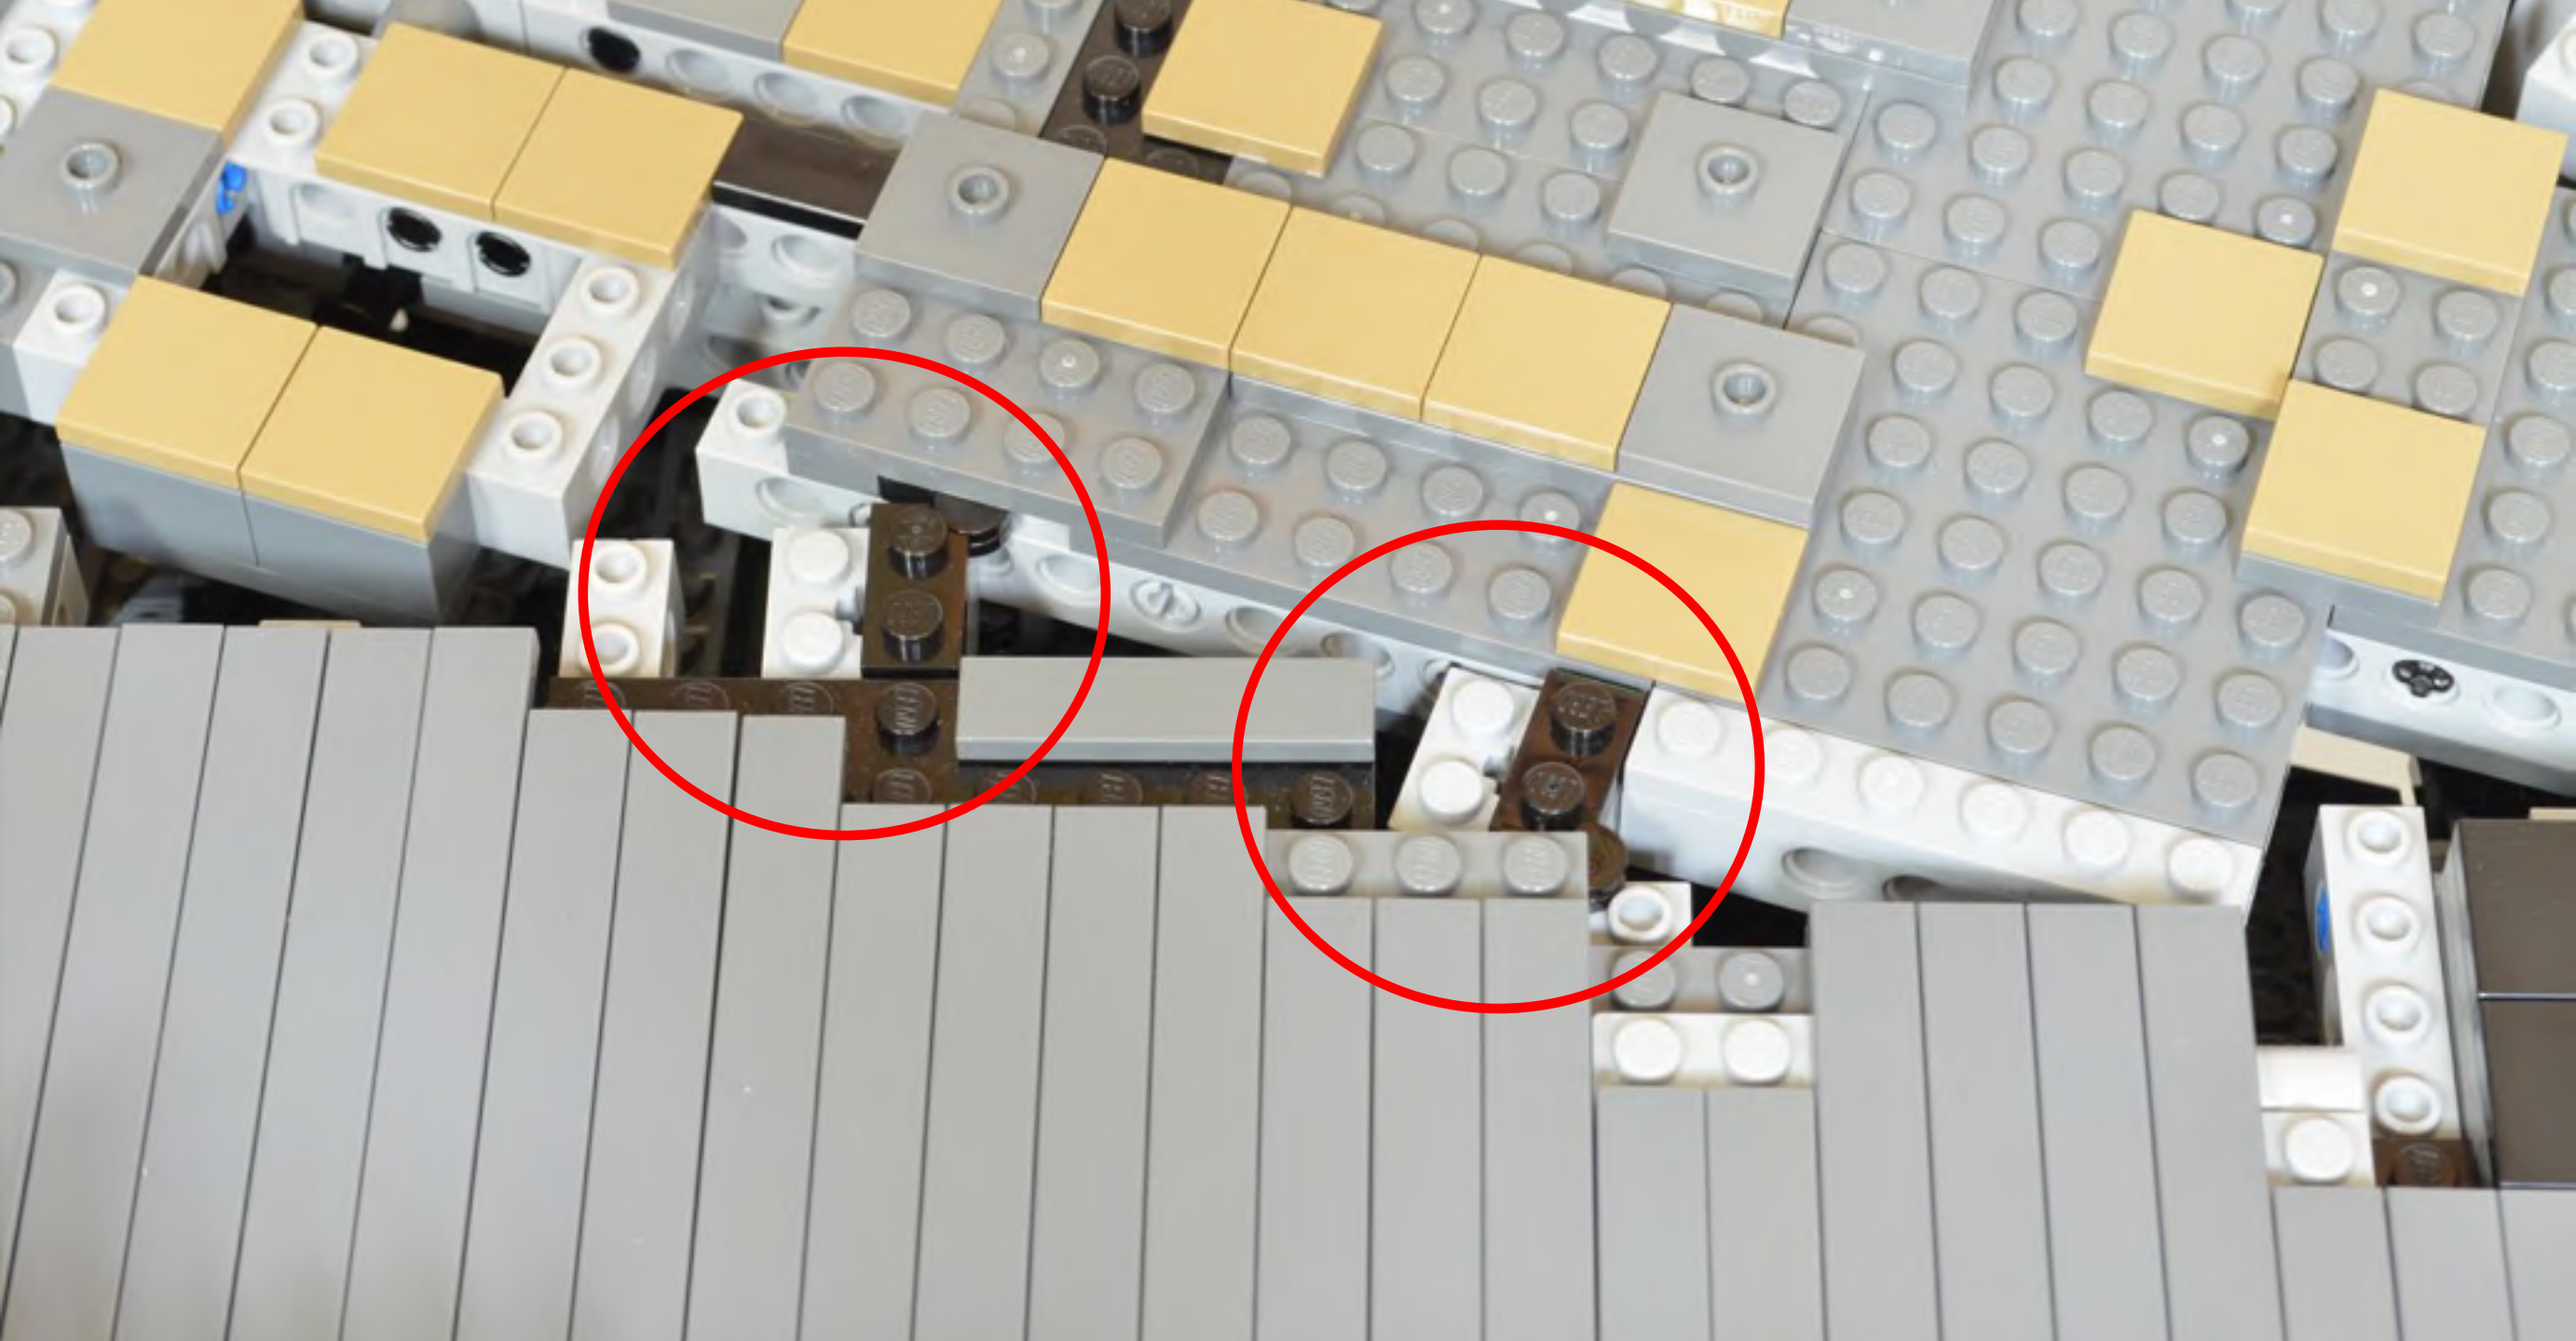
Rear technic joint

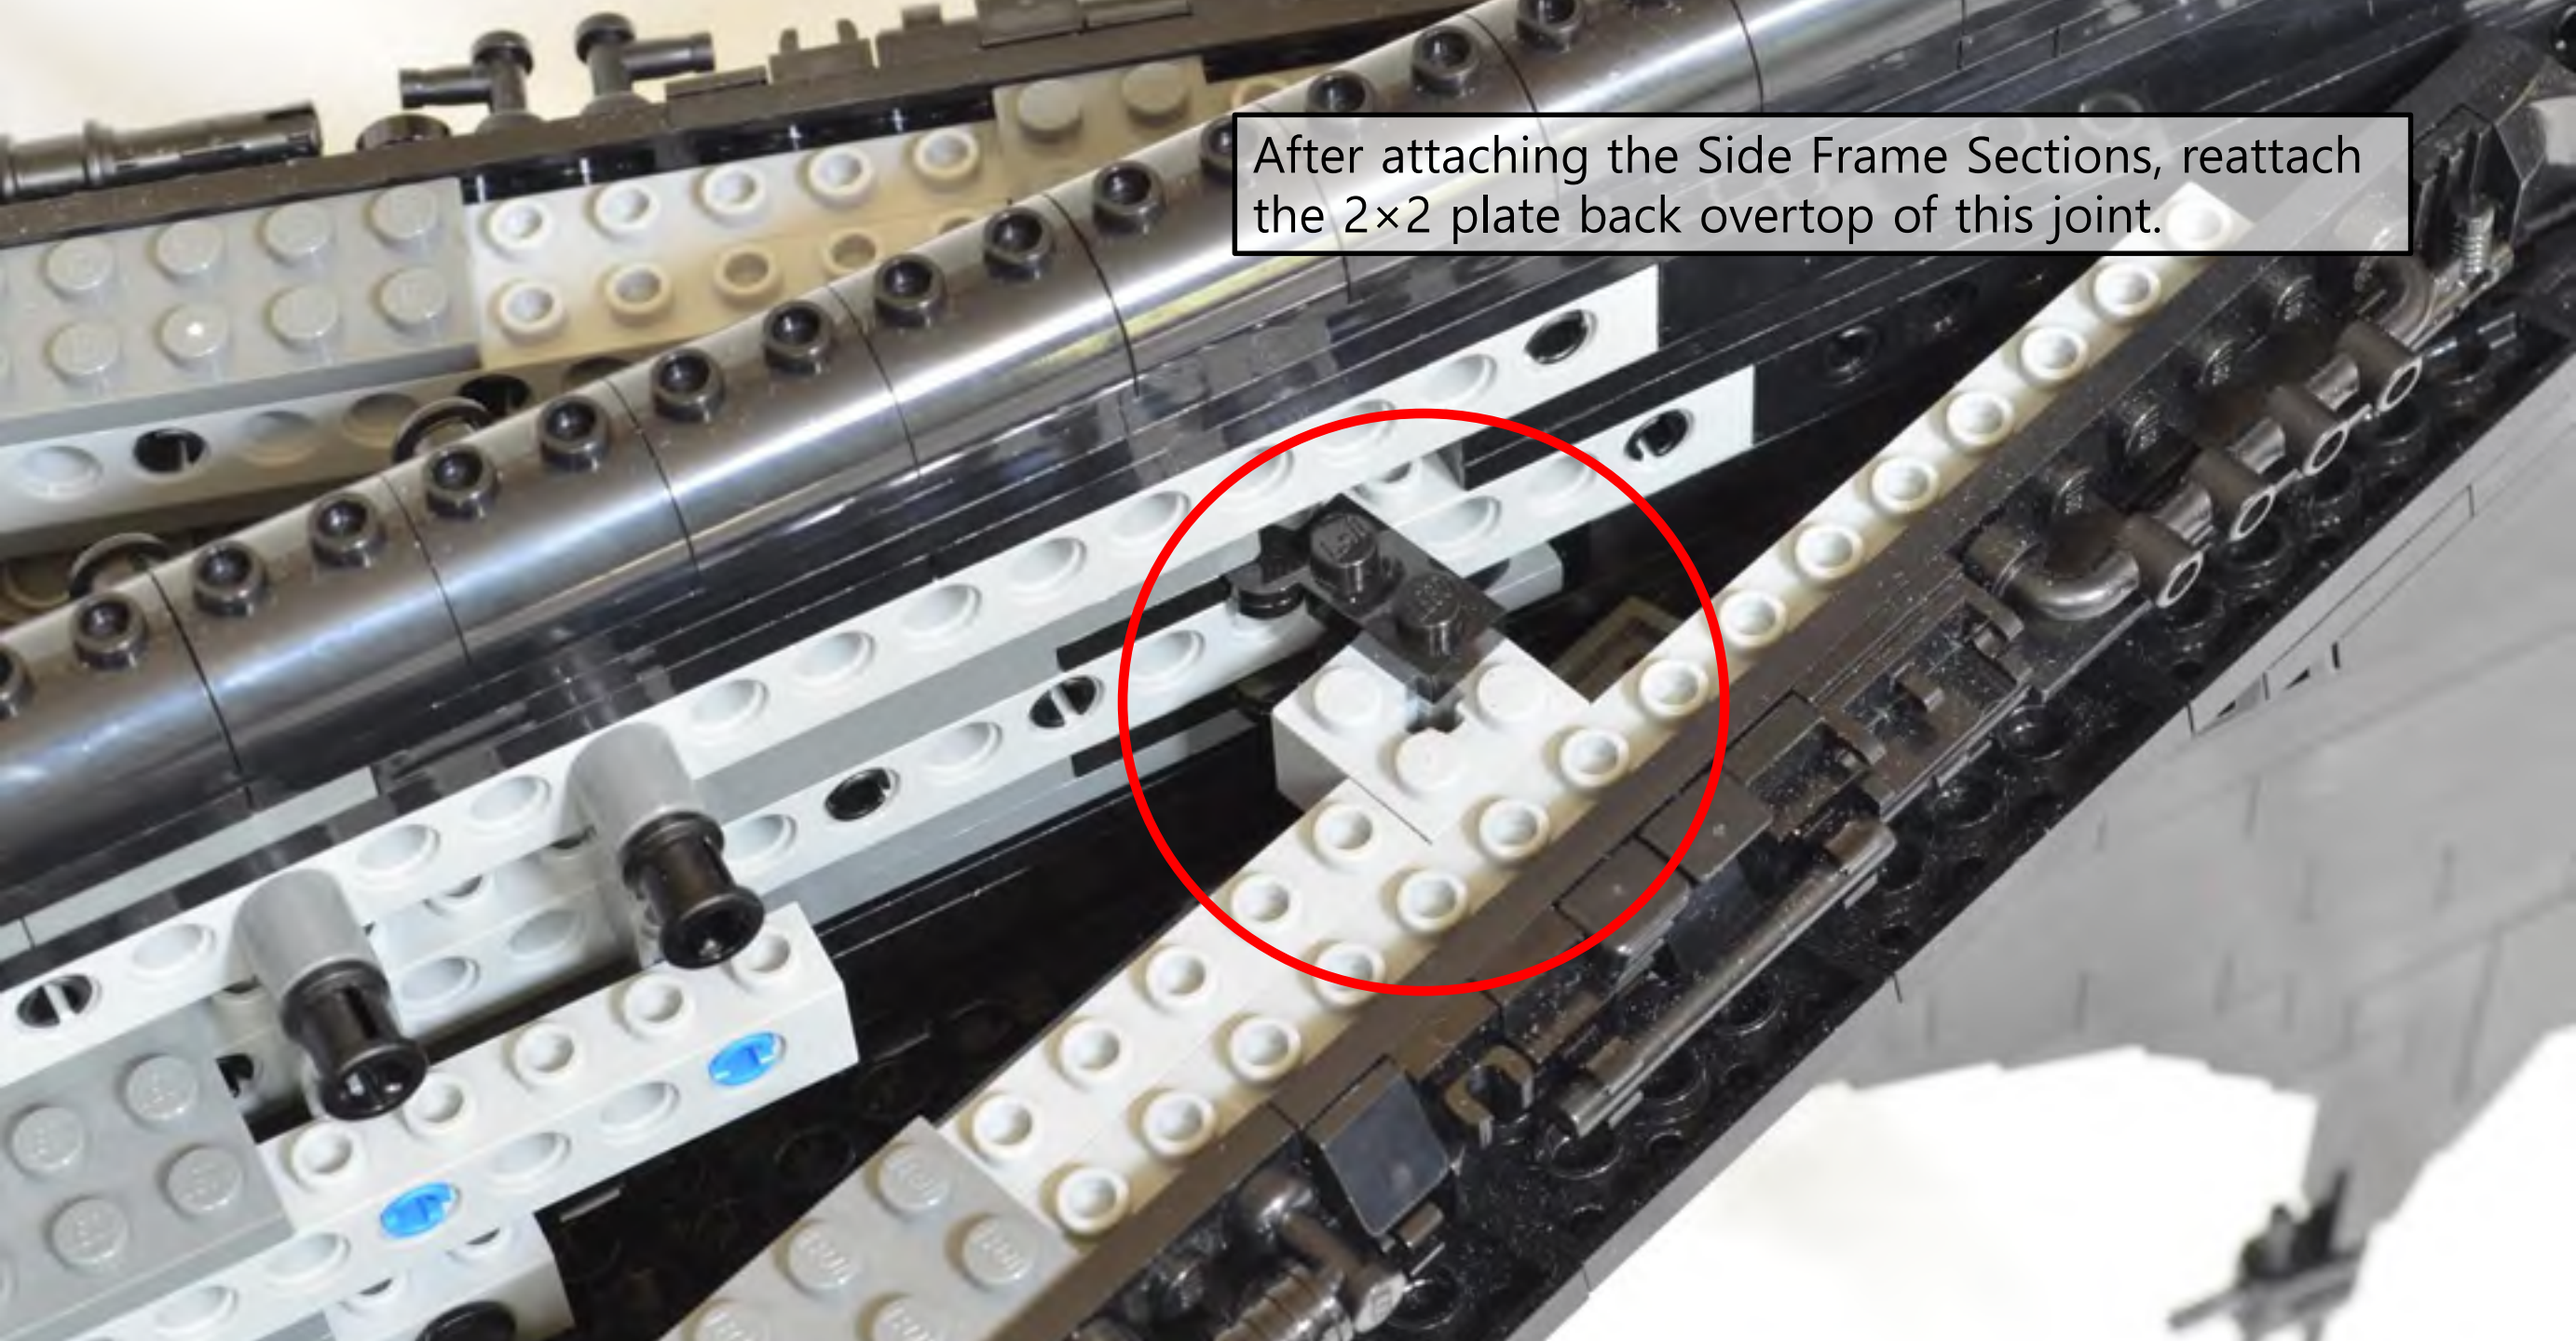


After you have the Right Lower Hull section attached, you will need to brace it with something so the model doesn't tip over. Here we have used a sleeping bag, but two pillows works equally well.



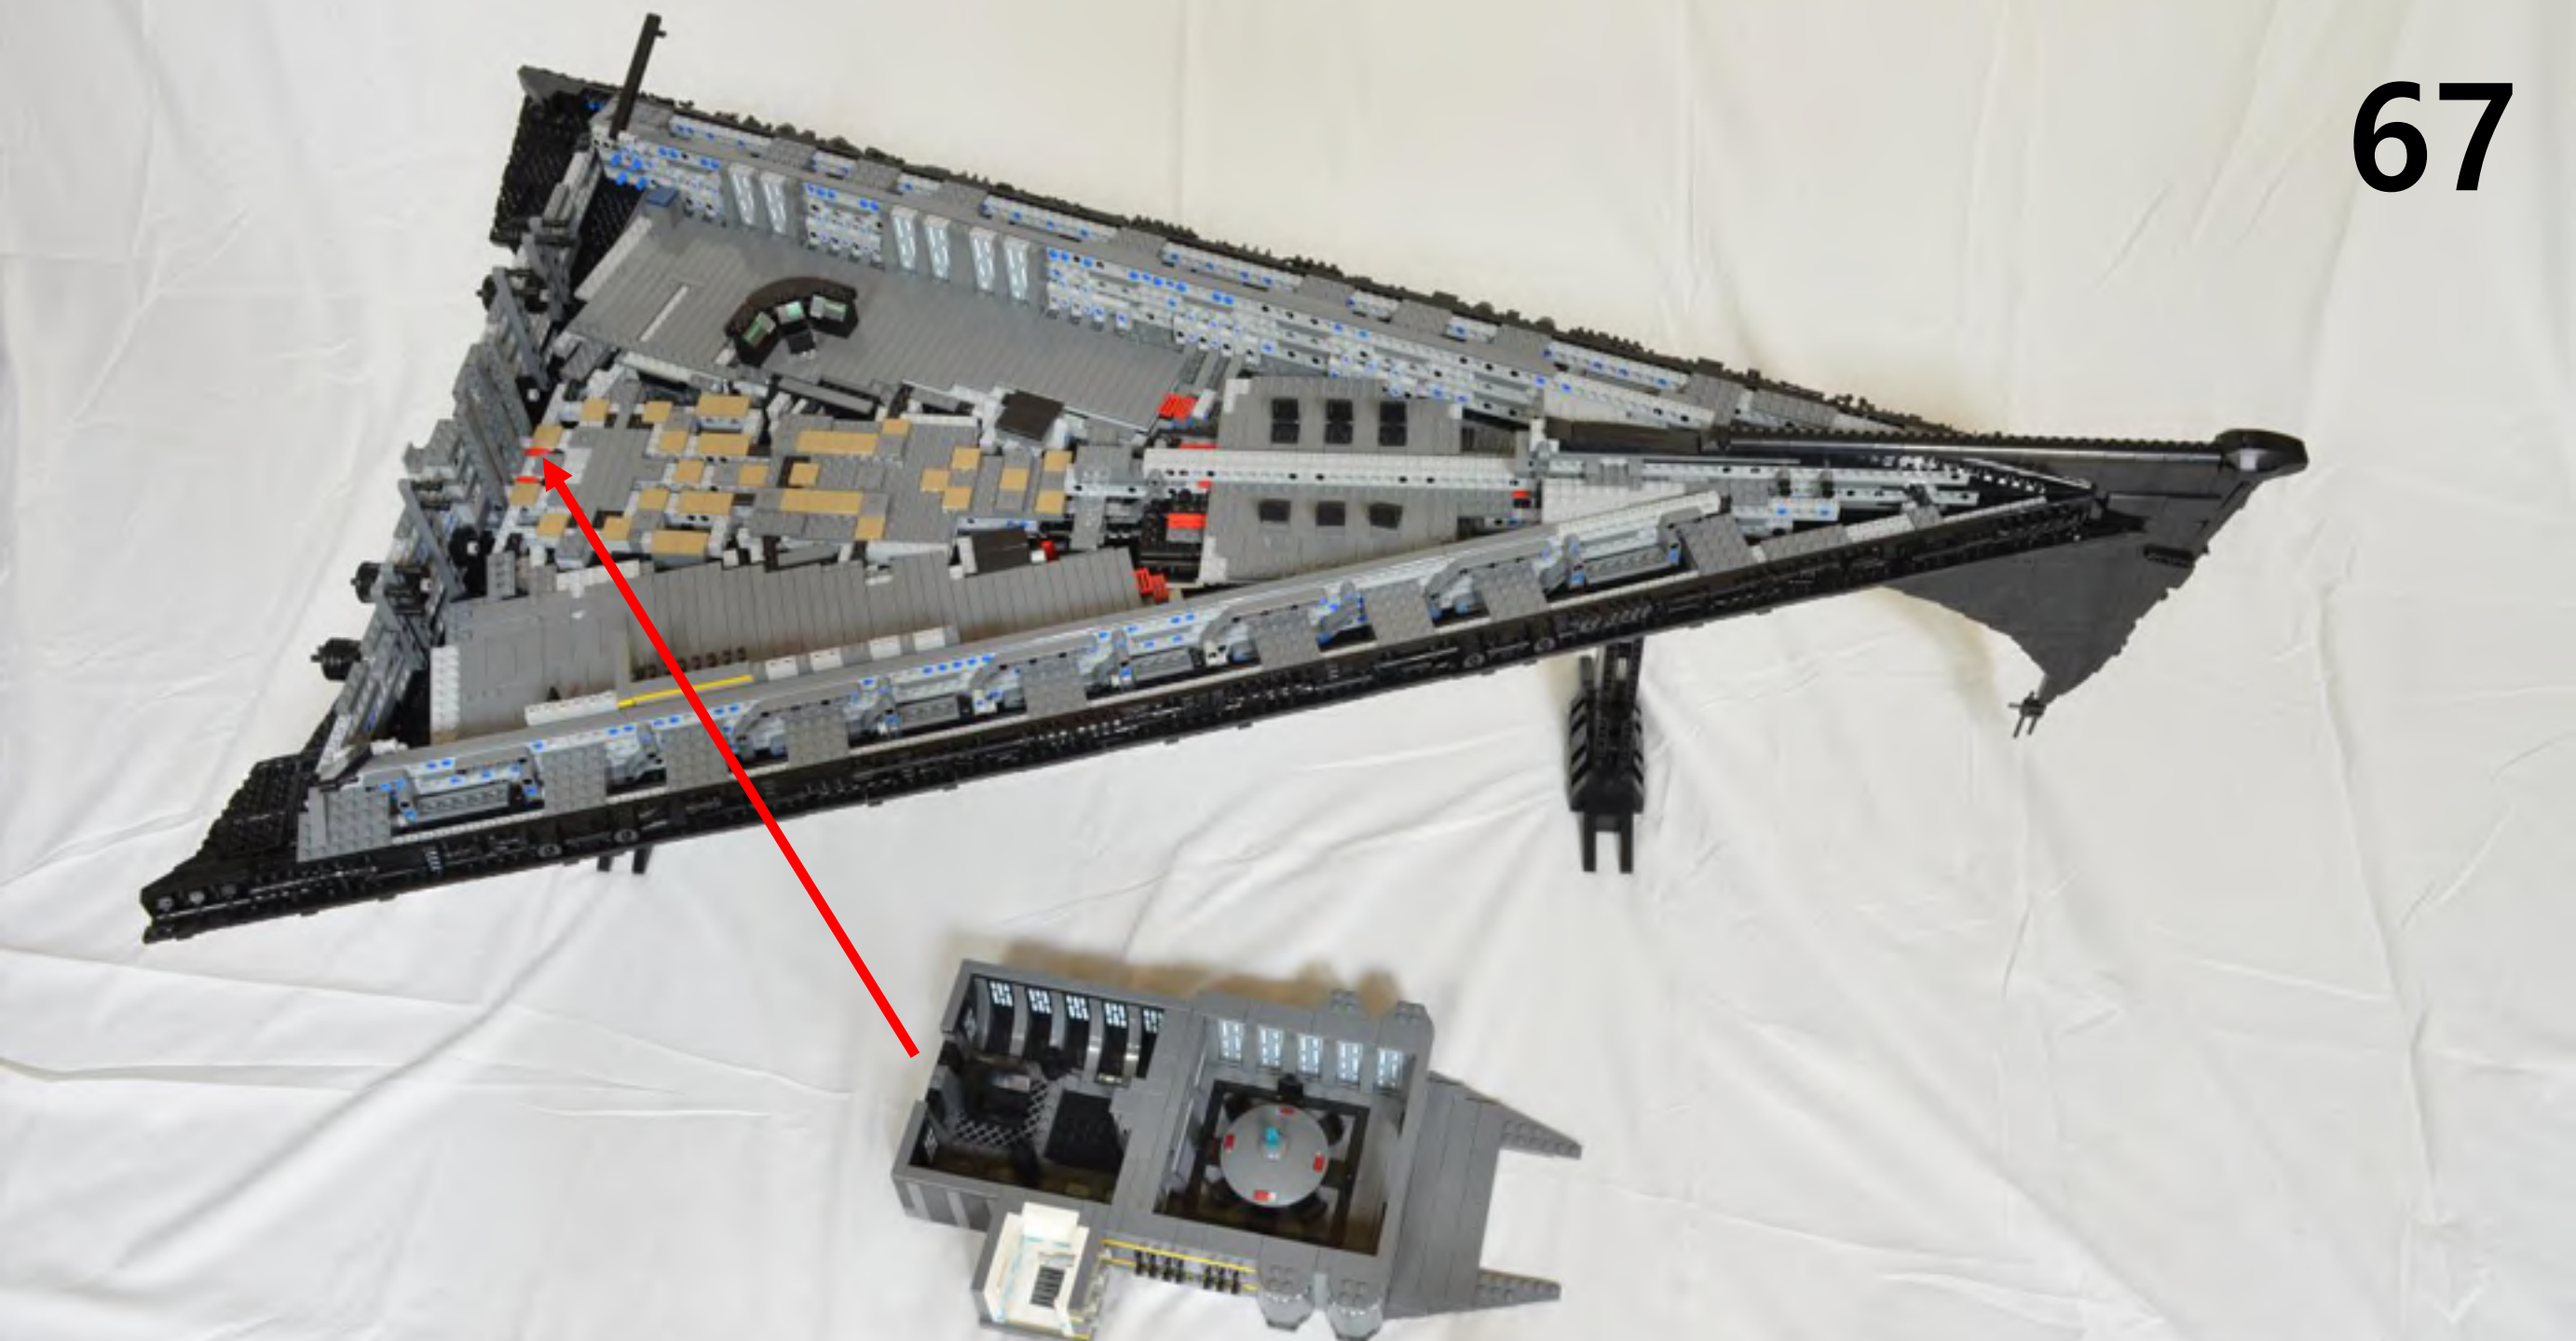


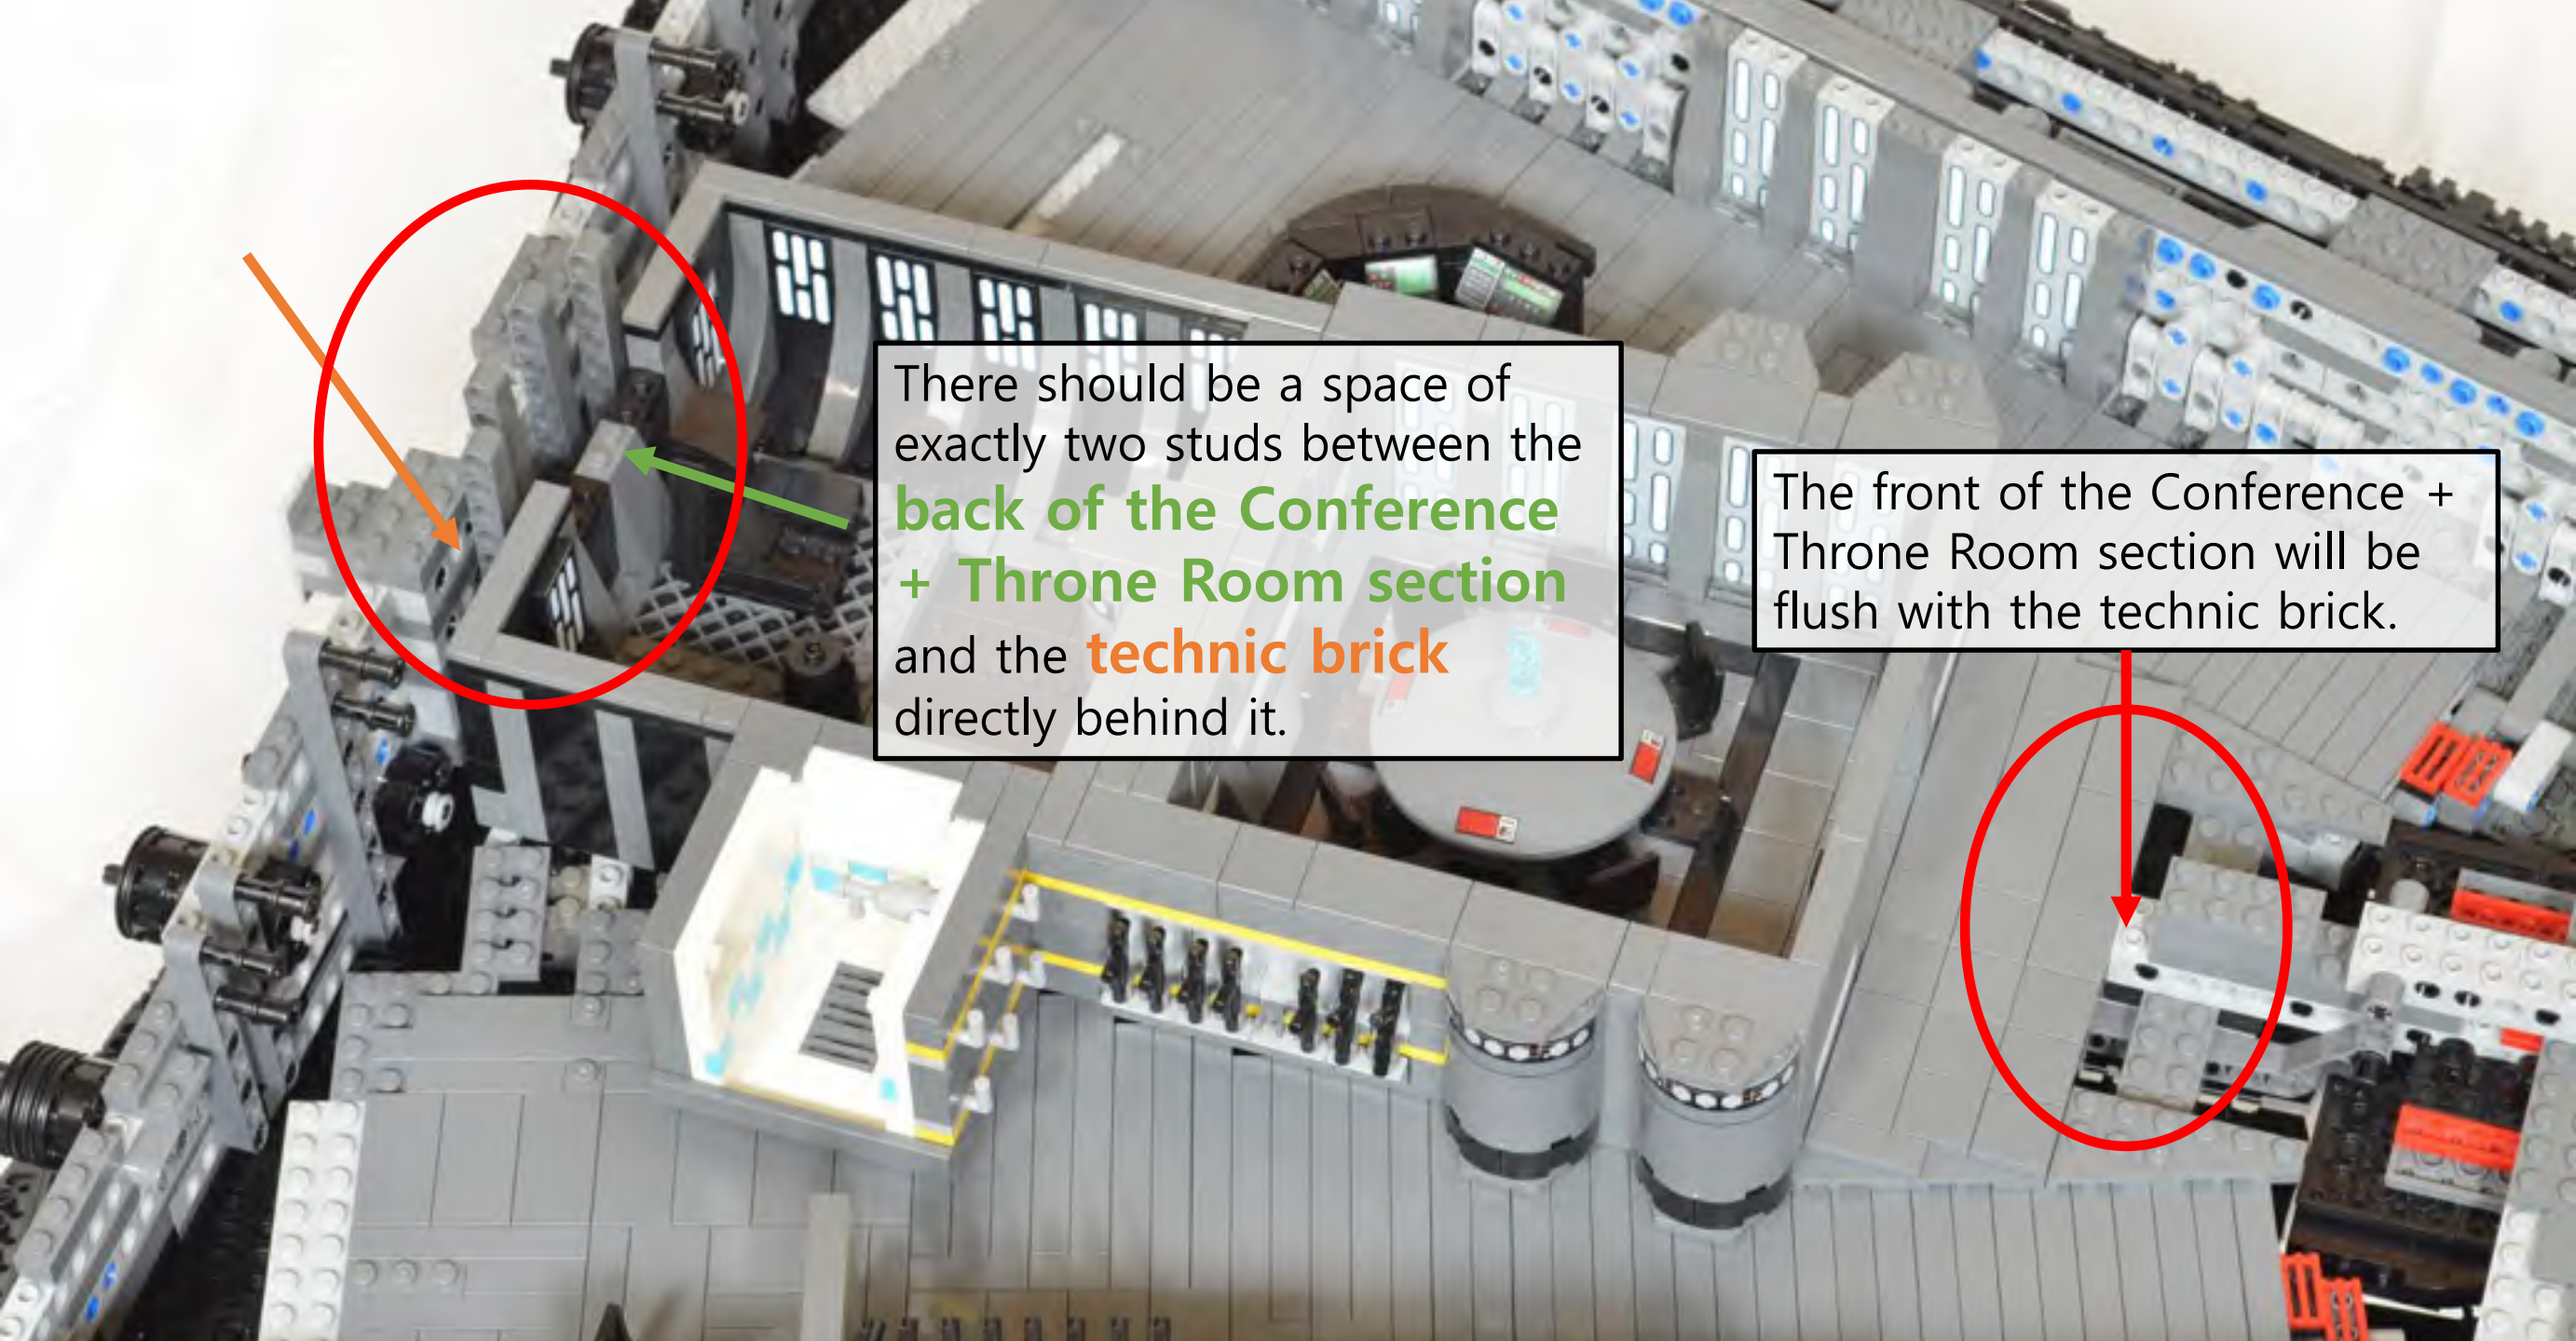




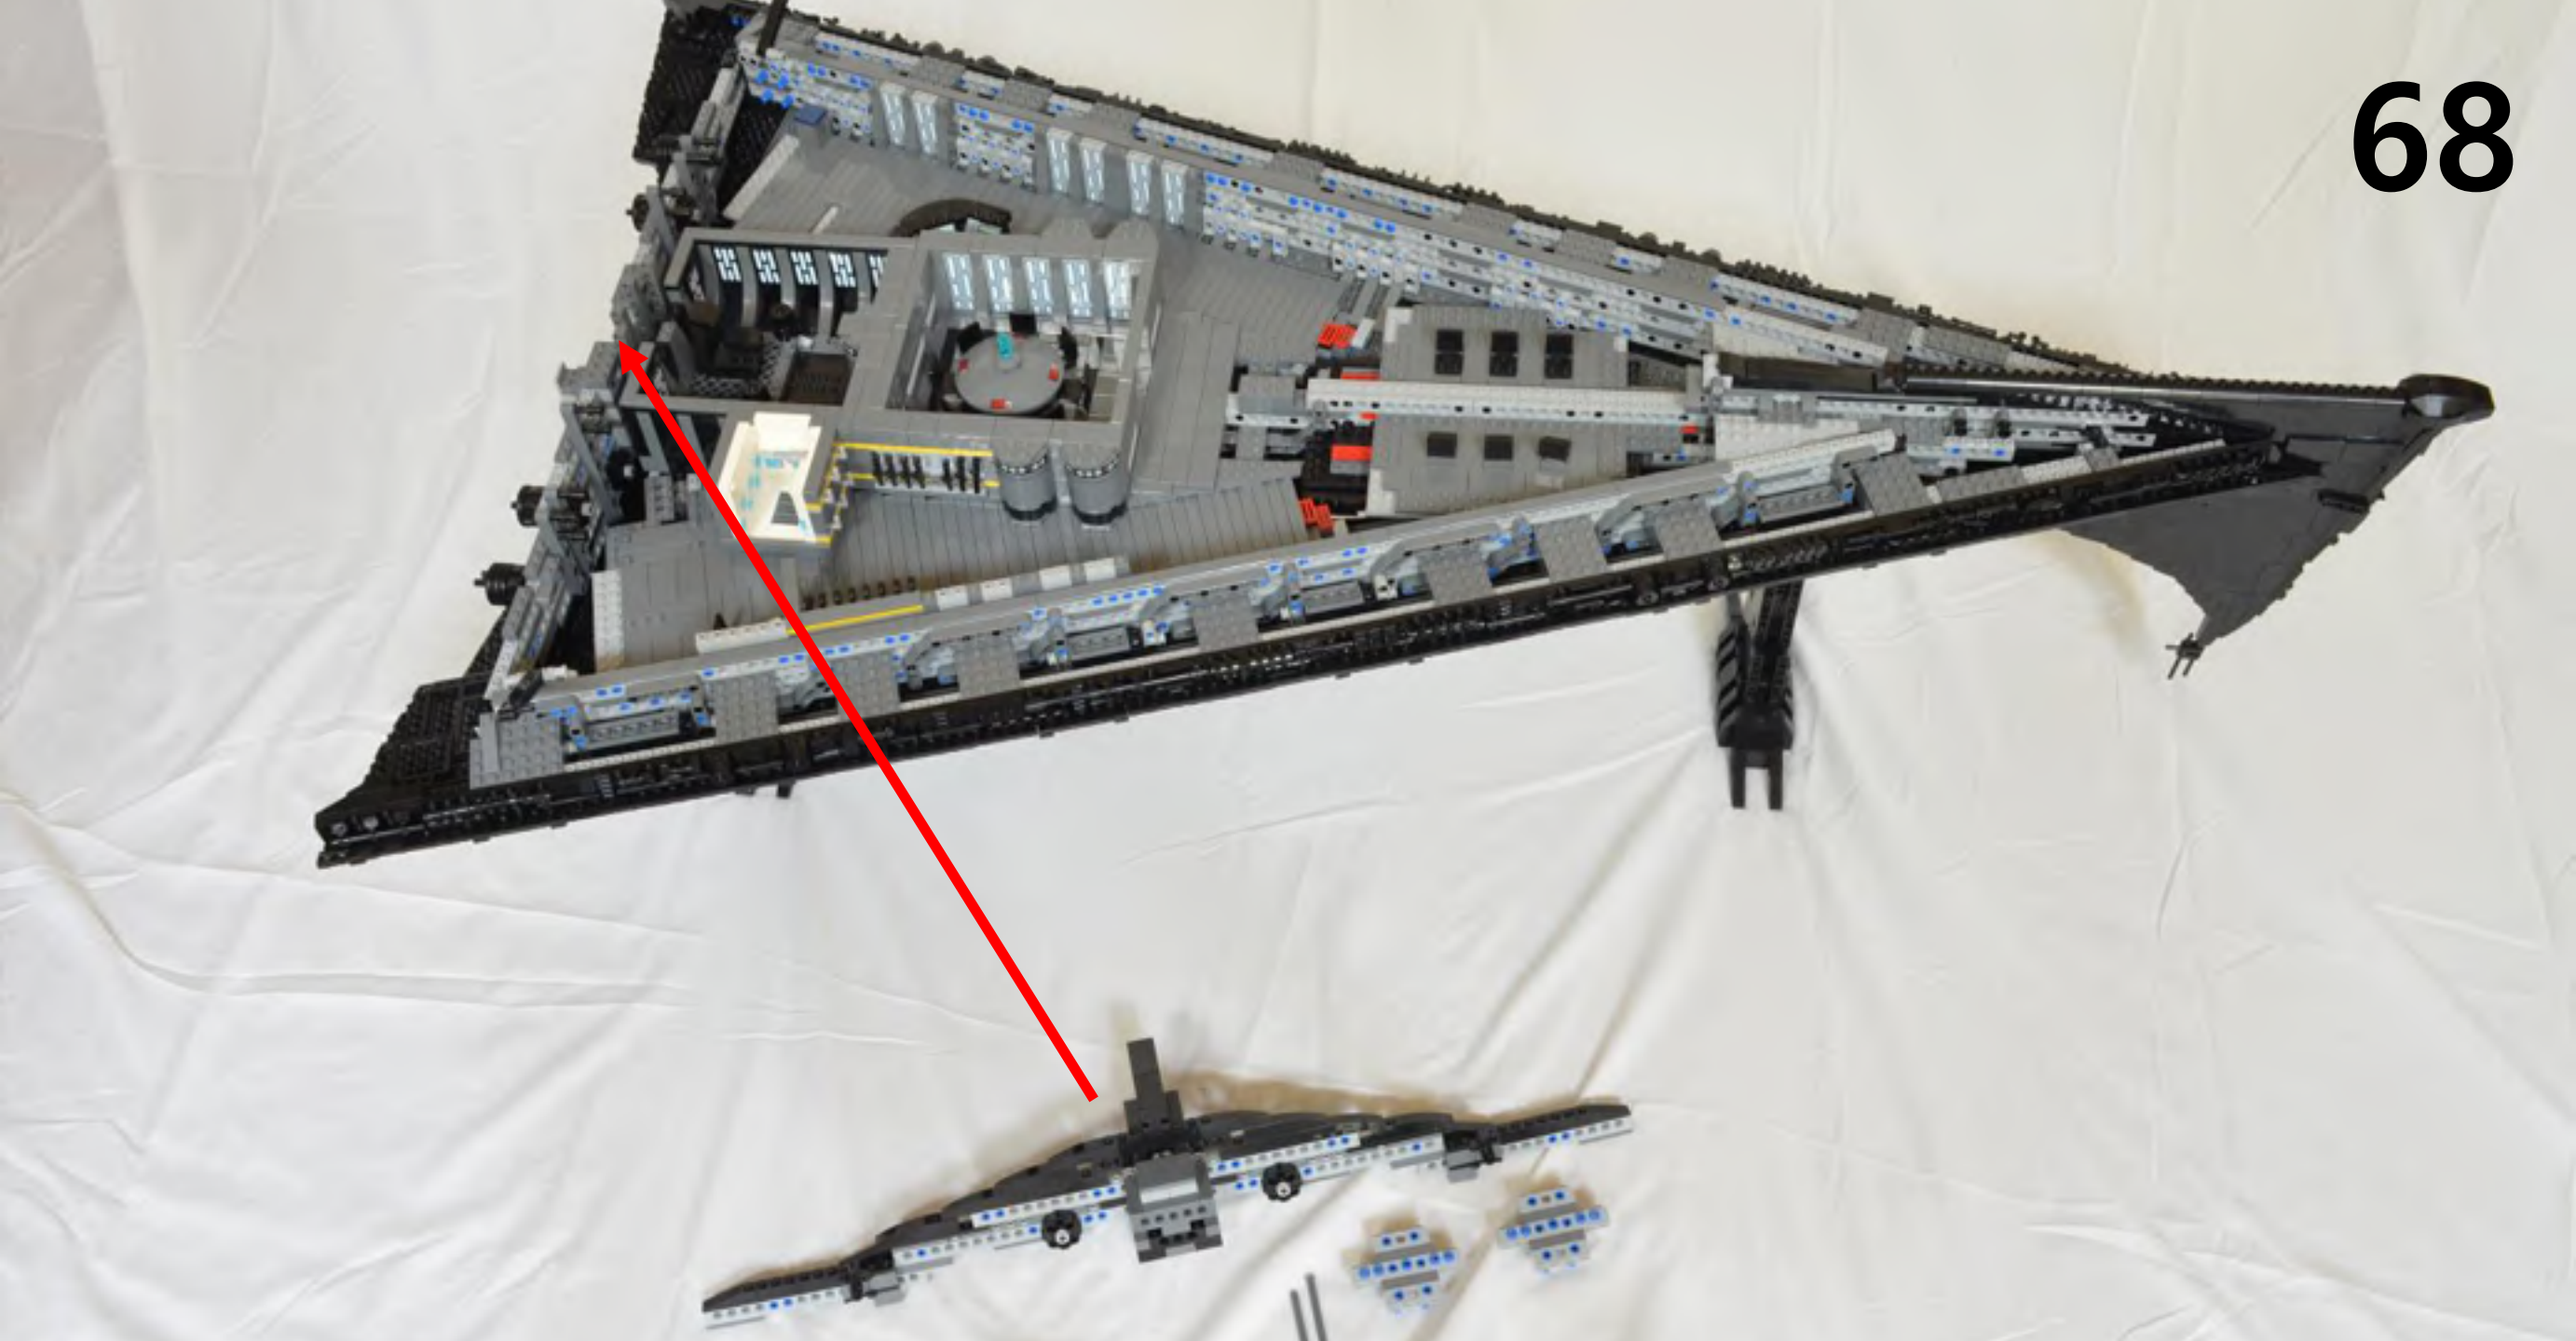
After attaching the Side Frame Sections, reattach the 2×2 plate back overtop of this joint.

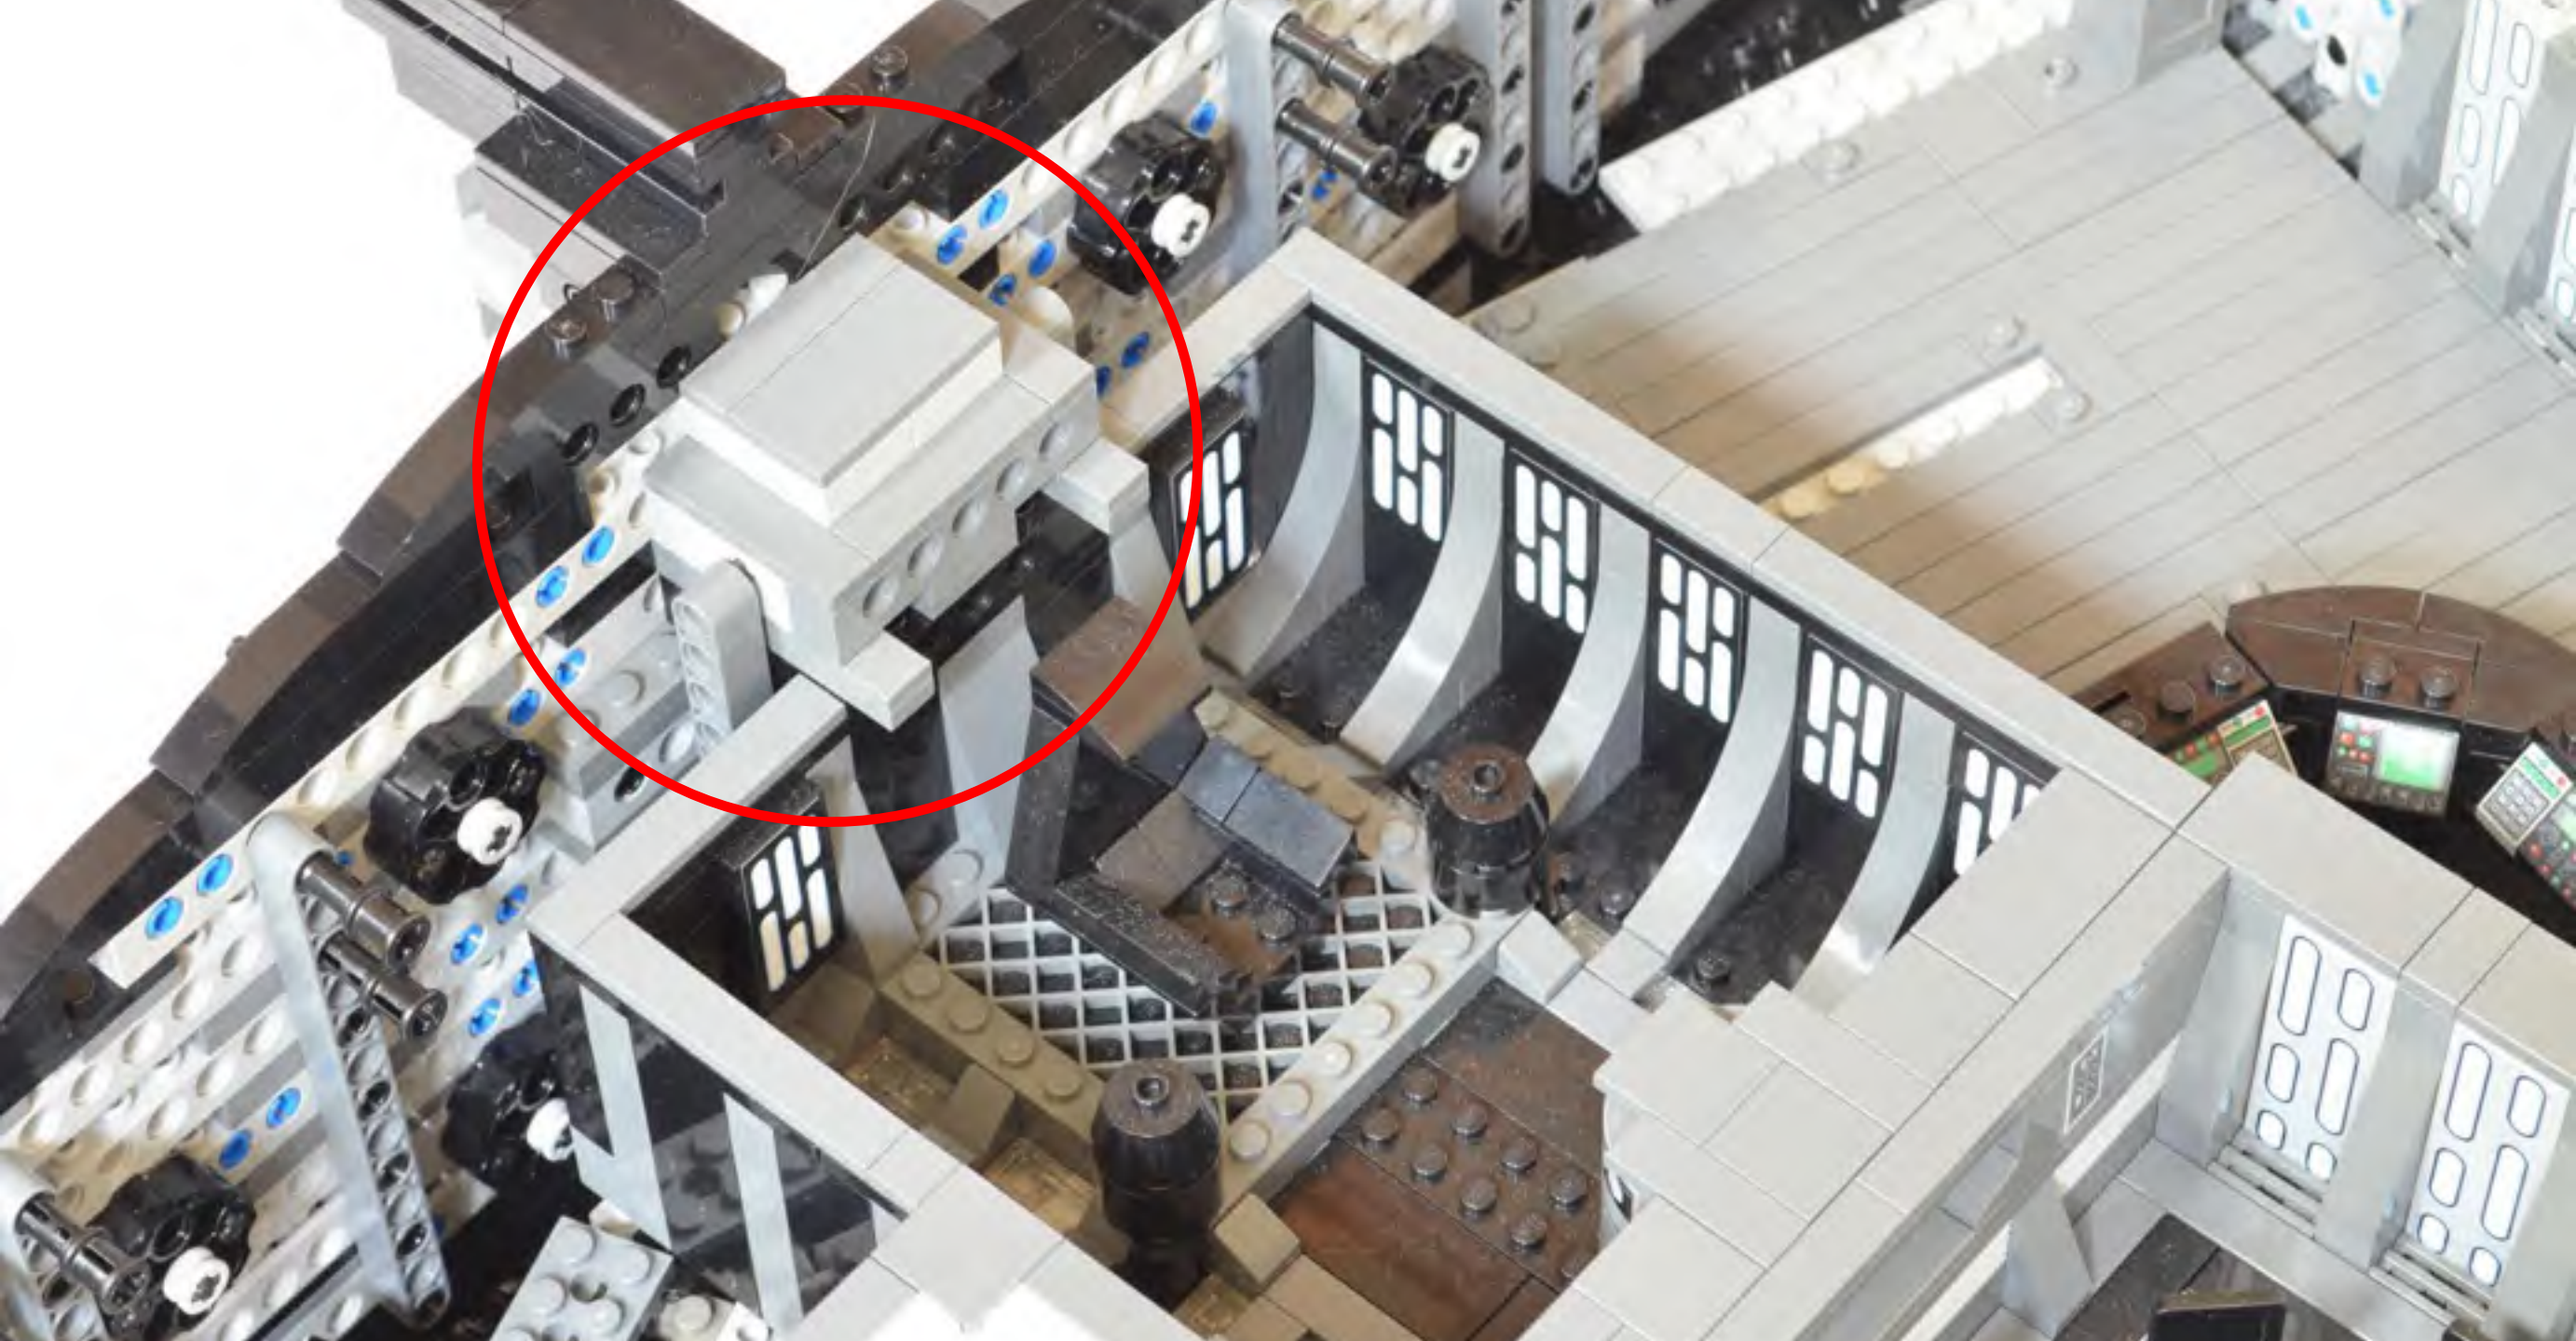
For this hinge, you will need to flex the black hinges around the technic brick, beginning with the bottom hinge. You will need to be careful that this does not damage the hinge. It is possible to remove parts from the side frame to avoid the need to flex, but this is difficult and time consuming.



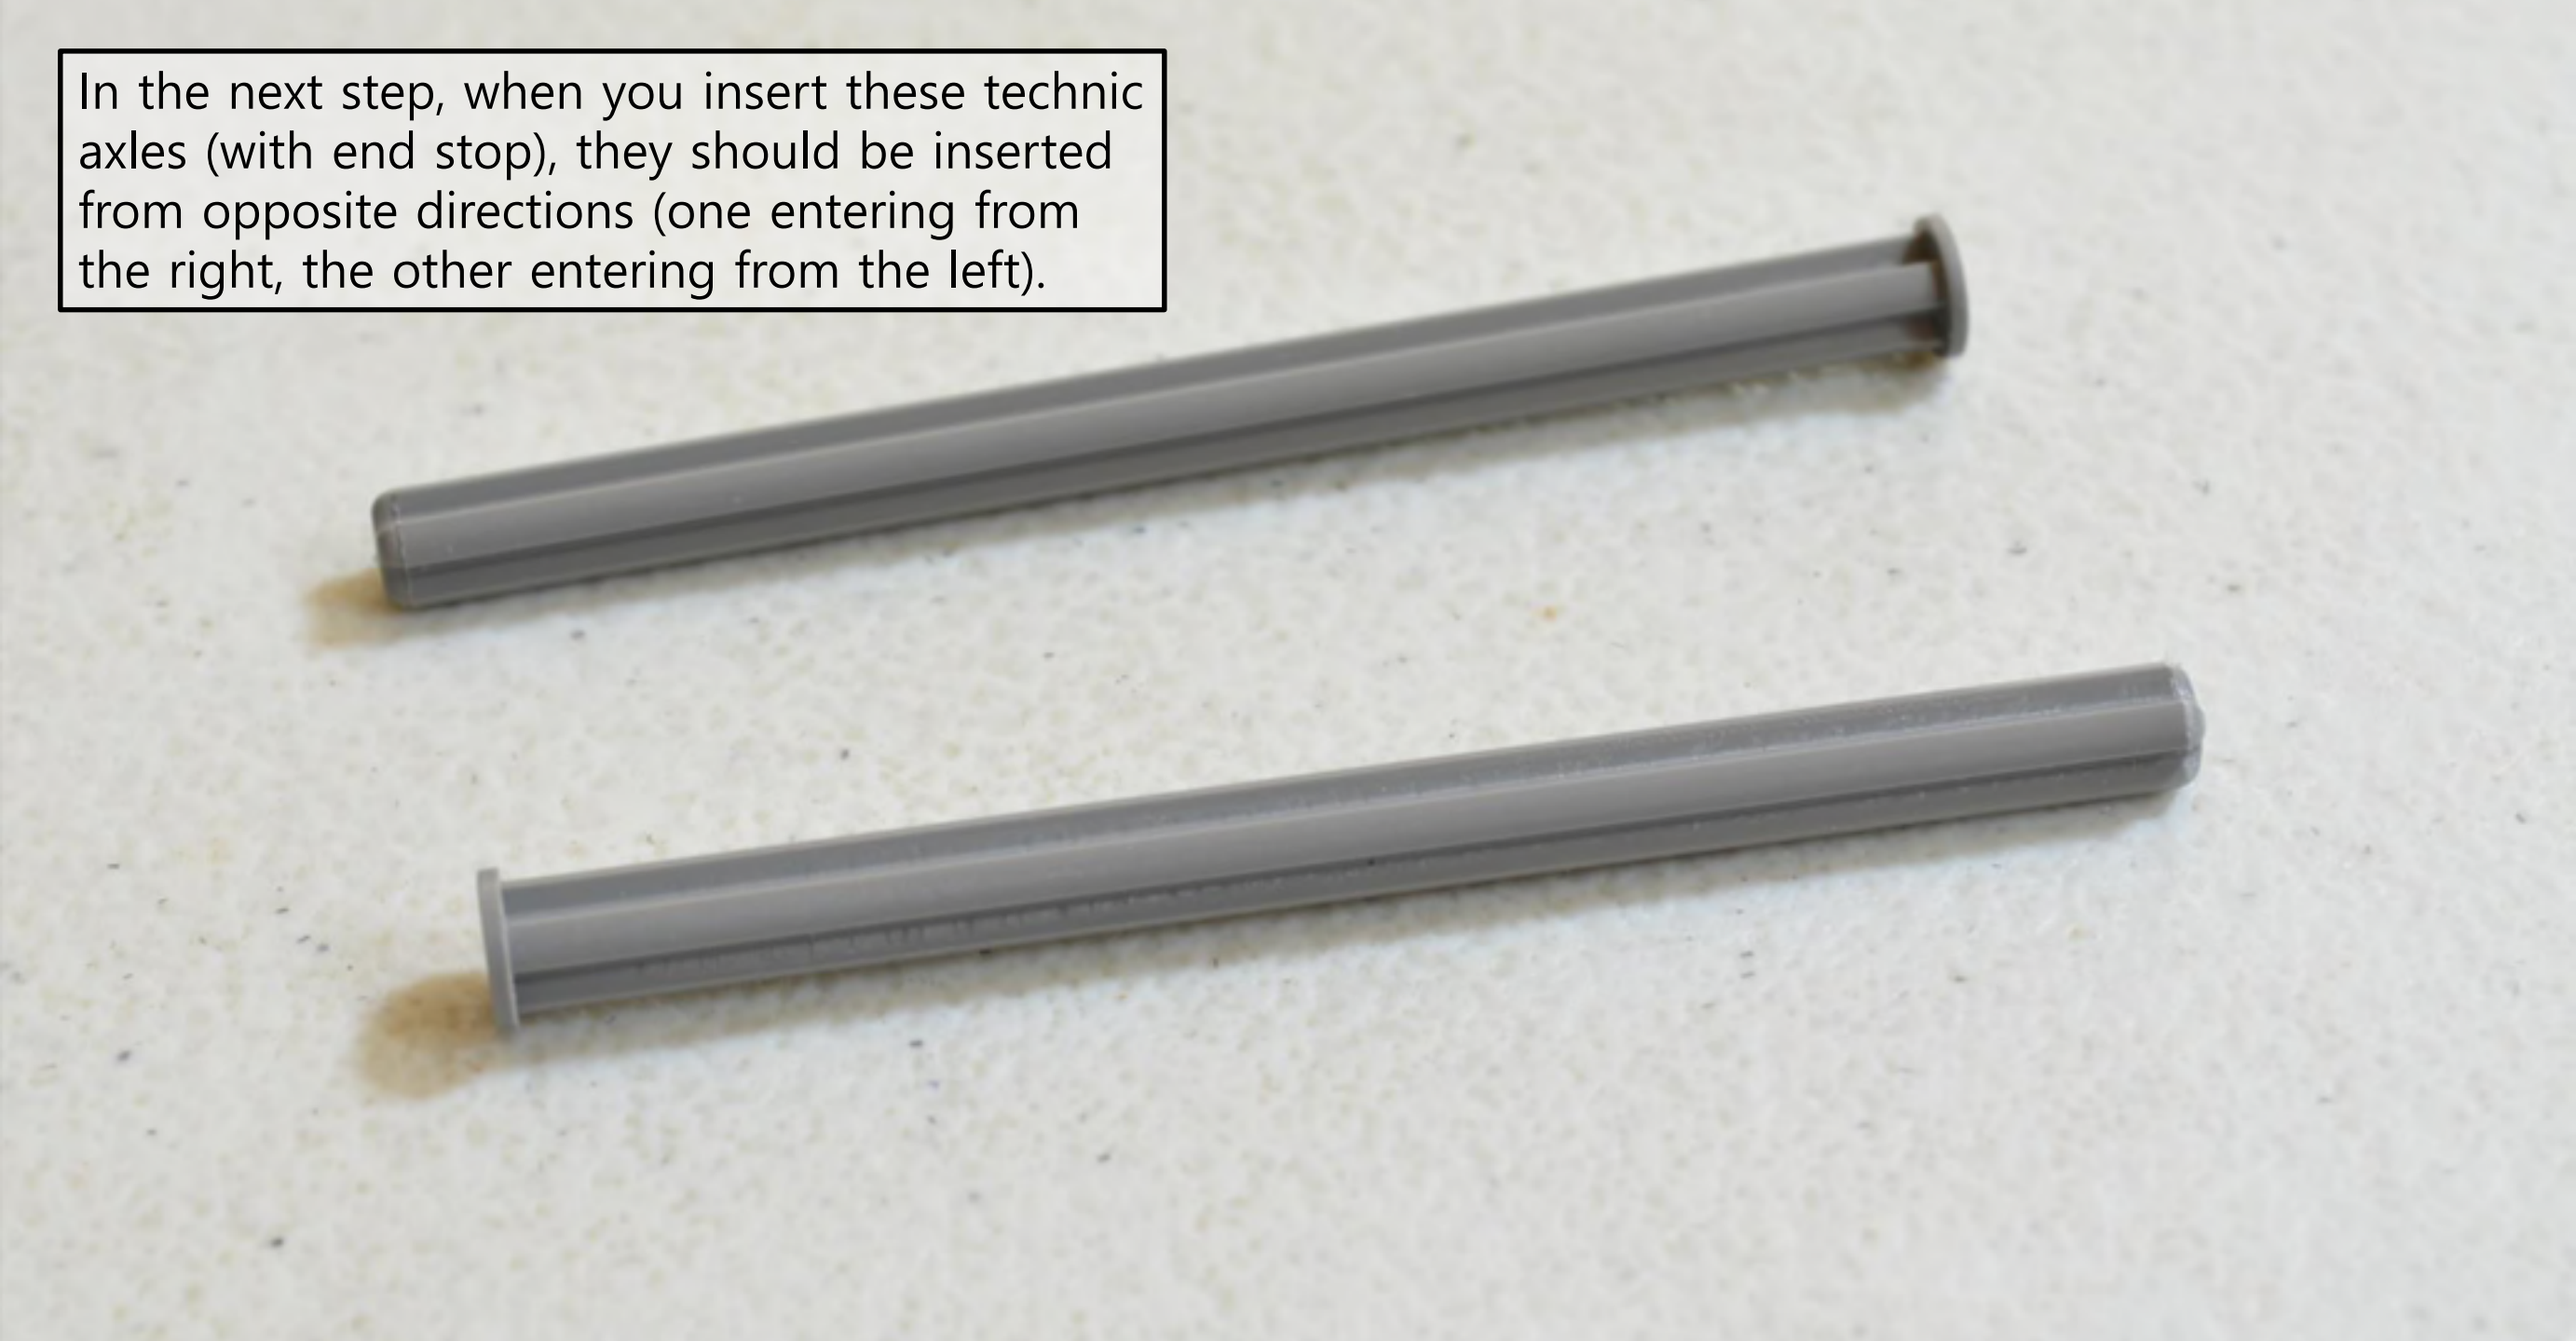


There should be a space of exactly two studs between the back of the Conference + Throne Room section and the technic brick directly behind it.
The front of the Conference + Throne Room section will be flush with the technic brick.

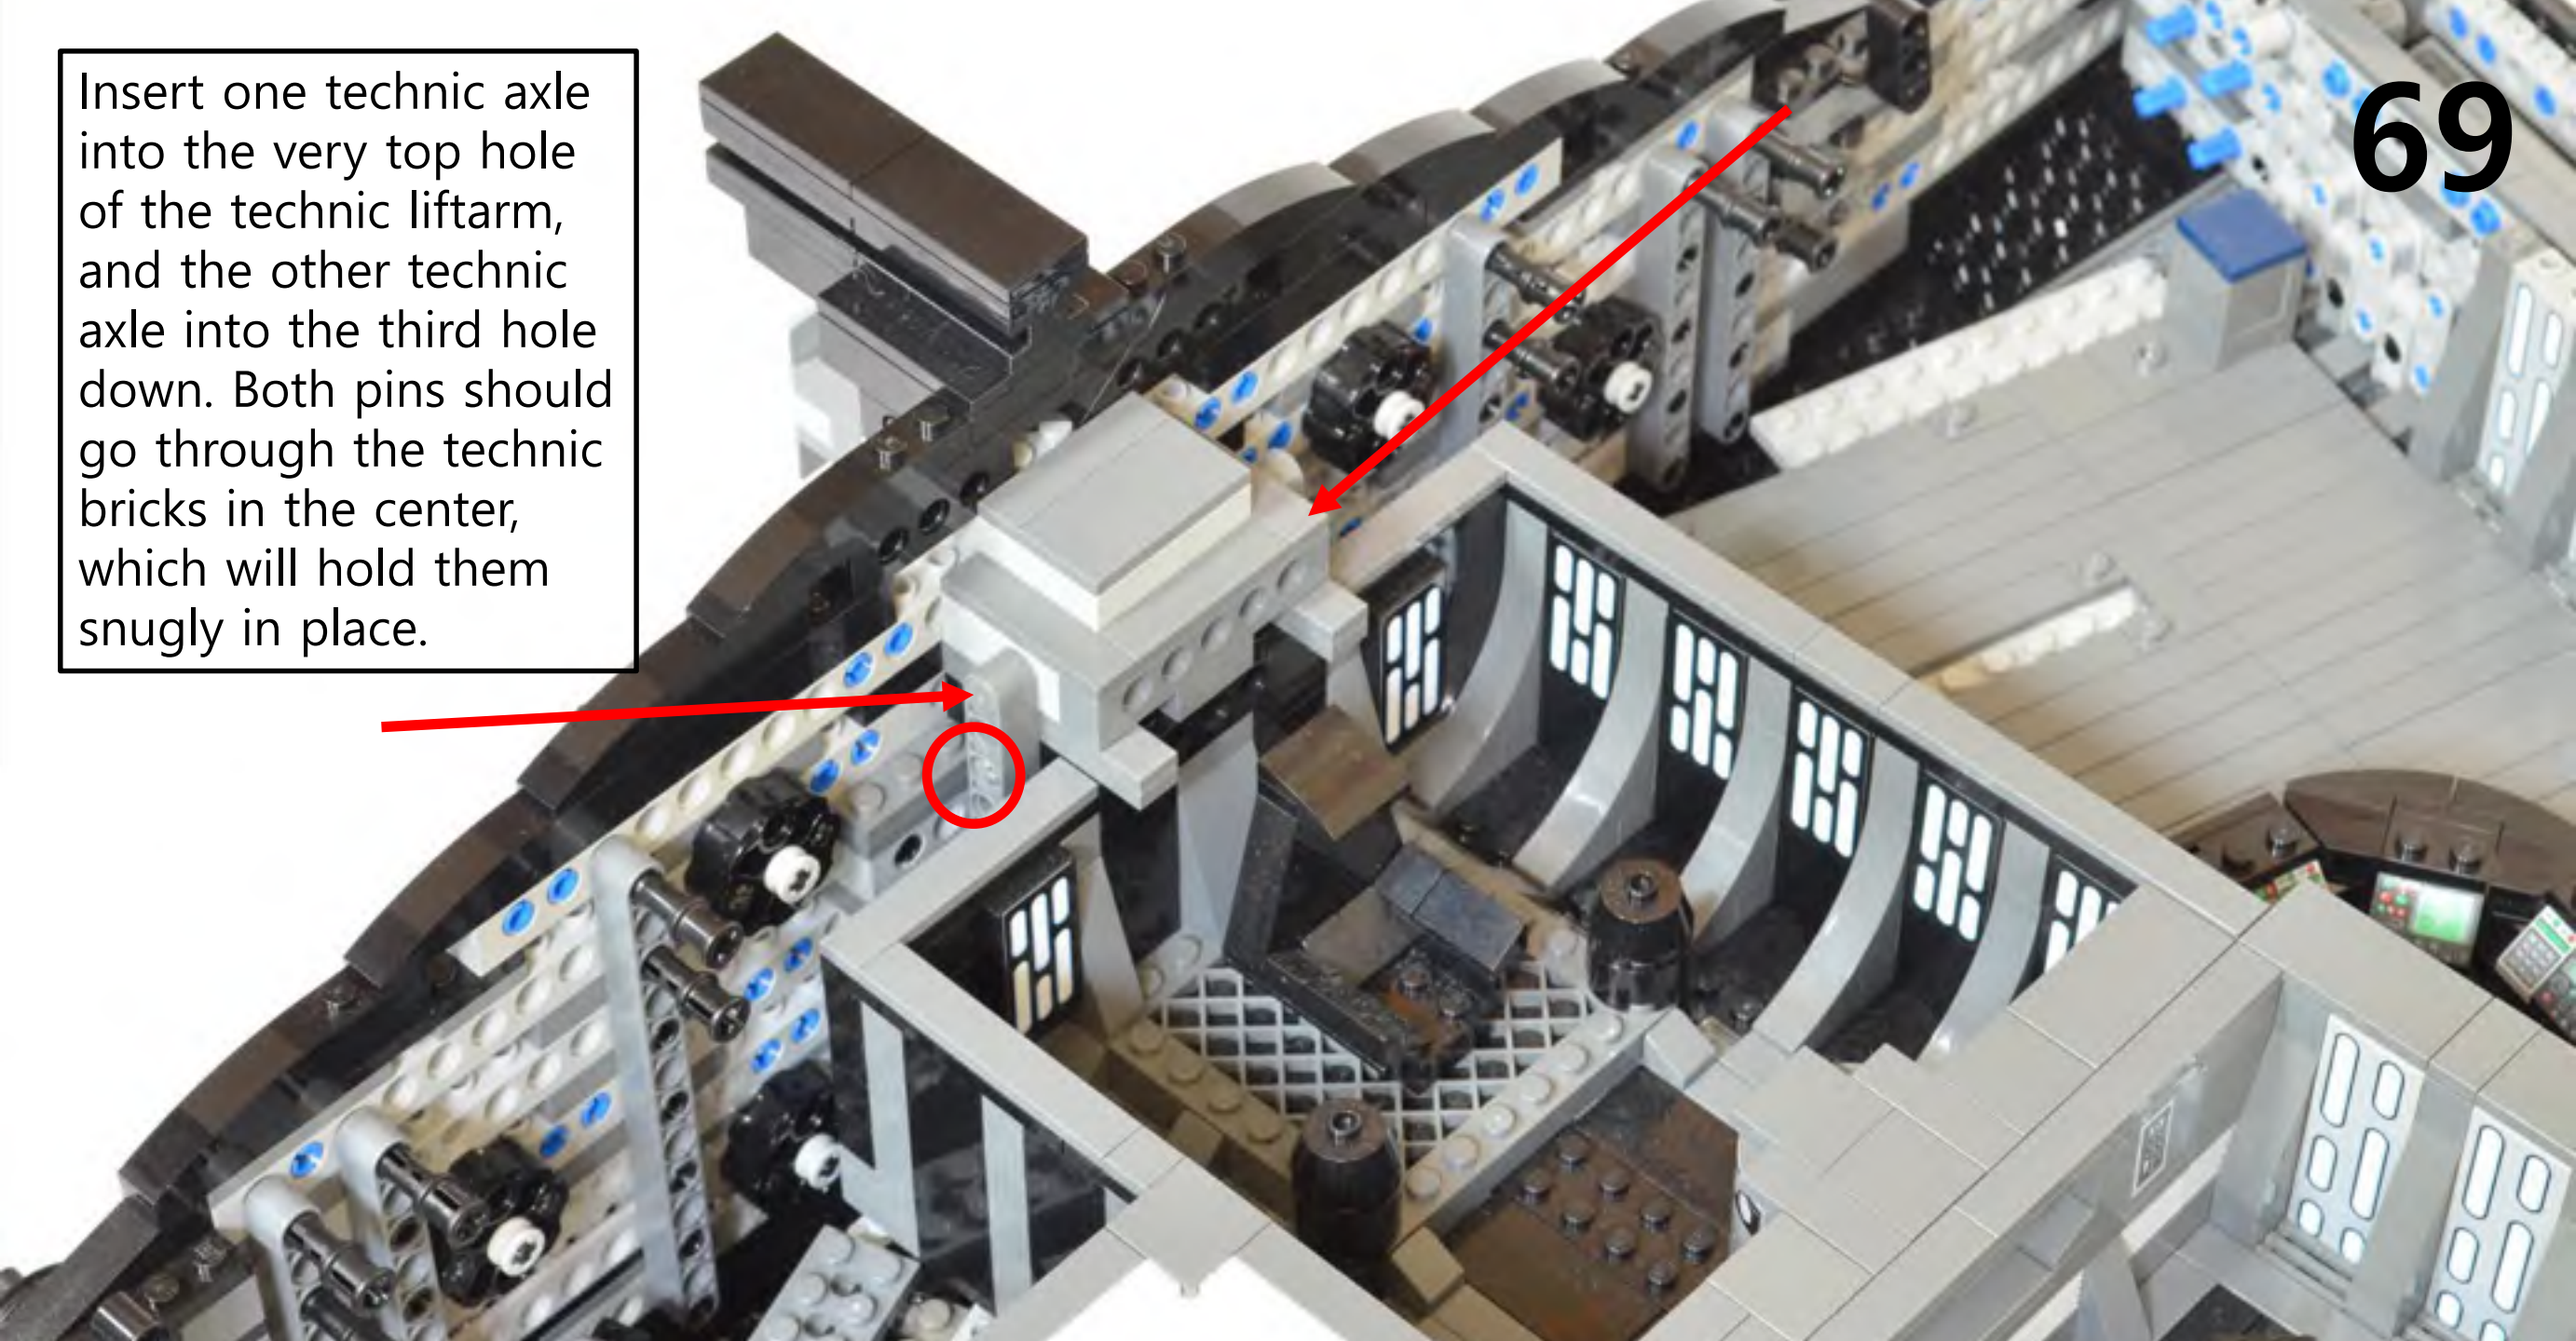




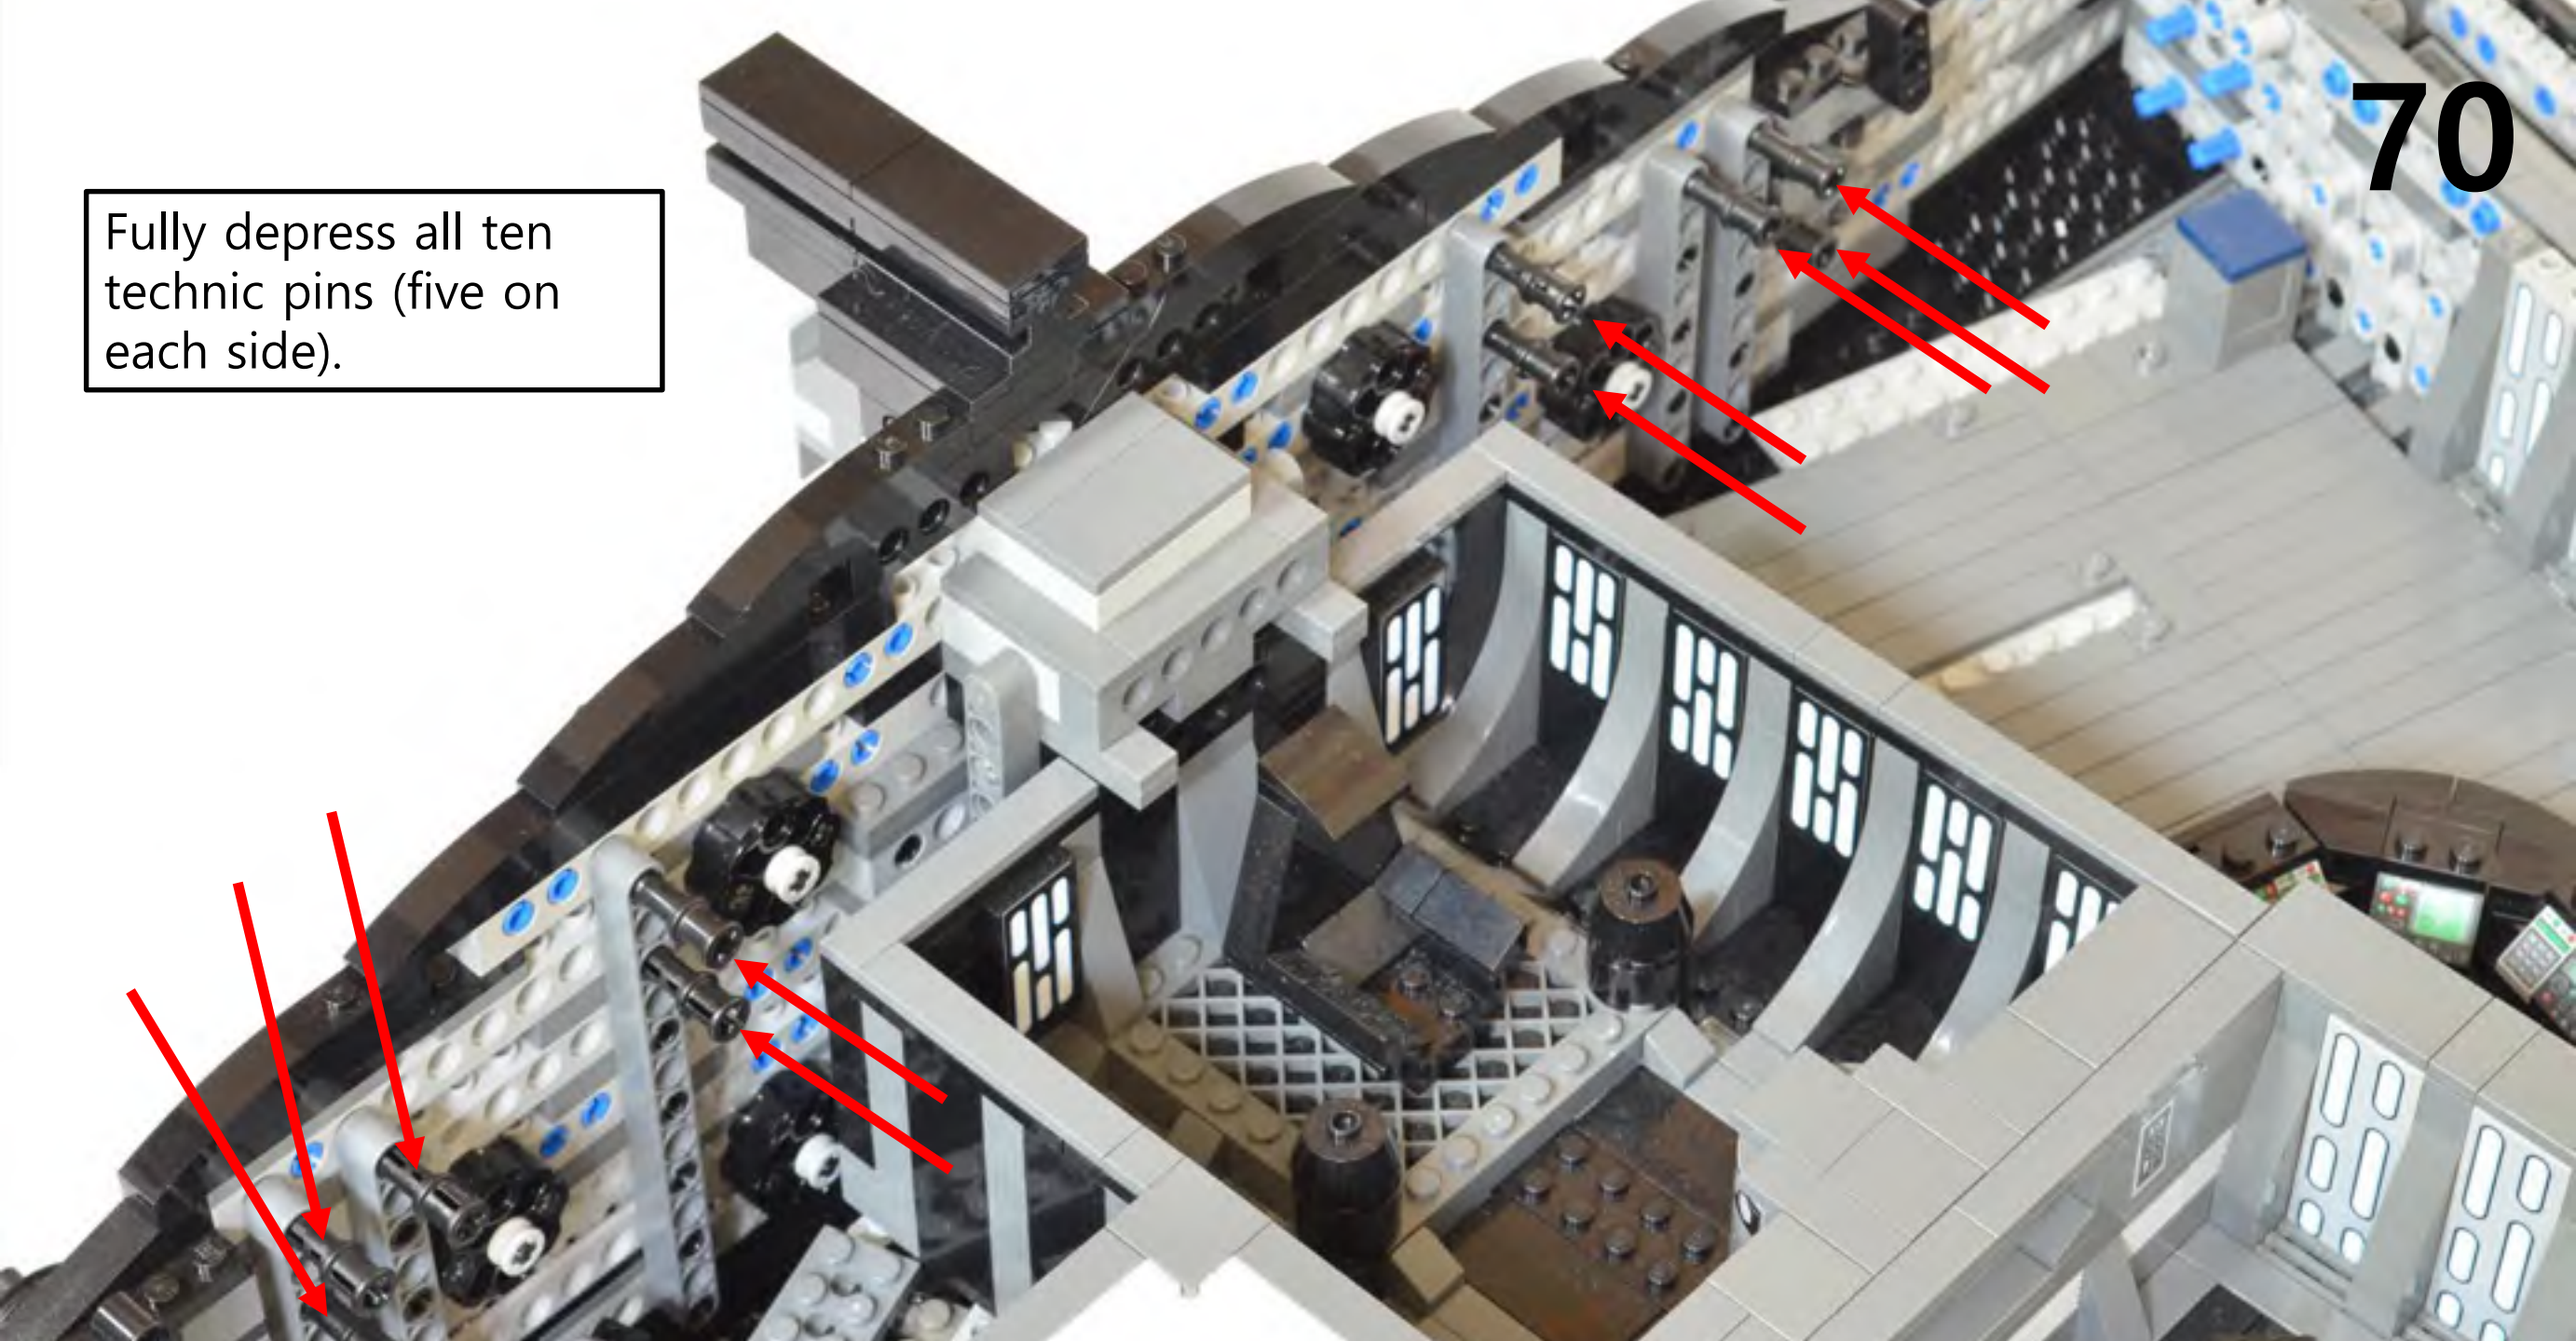
In the next step, when you insert these technic axles (with end stop), they should be inserted from opposite directions (one entering from the right, the other entering from the left).

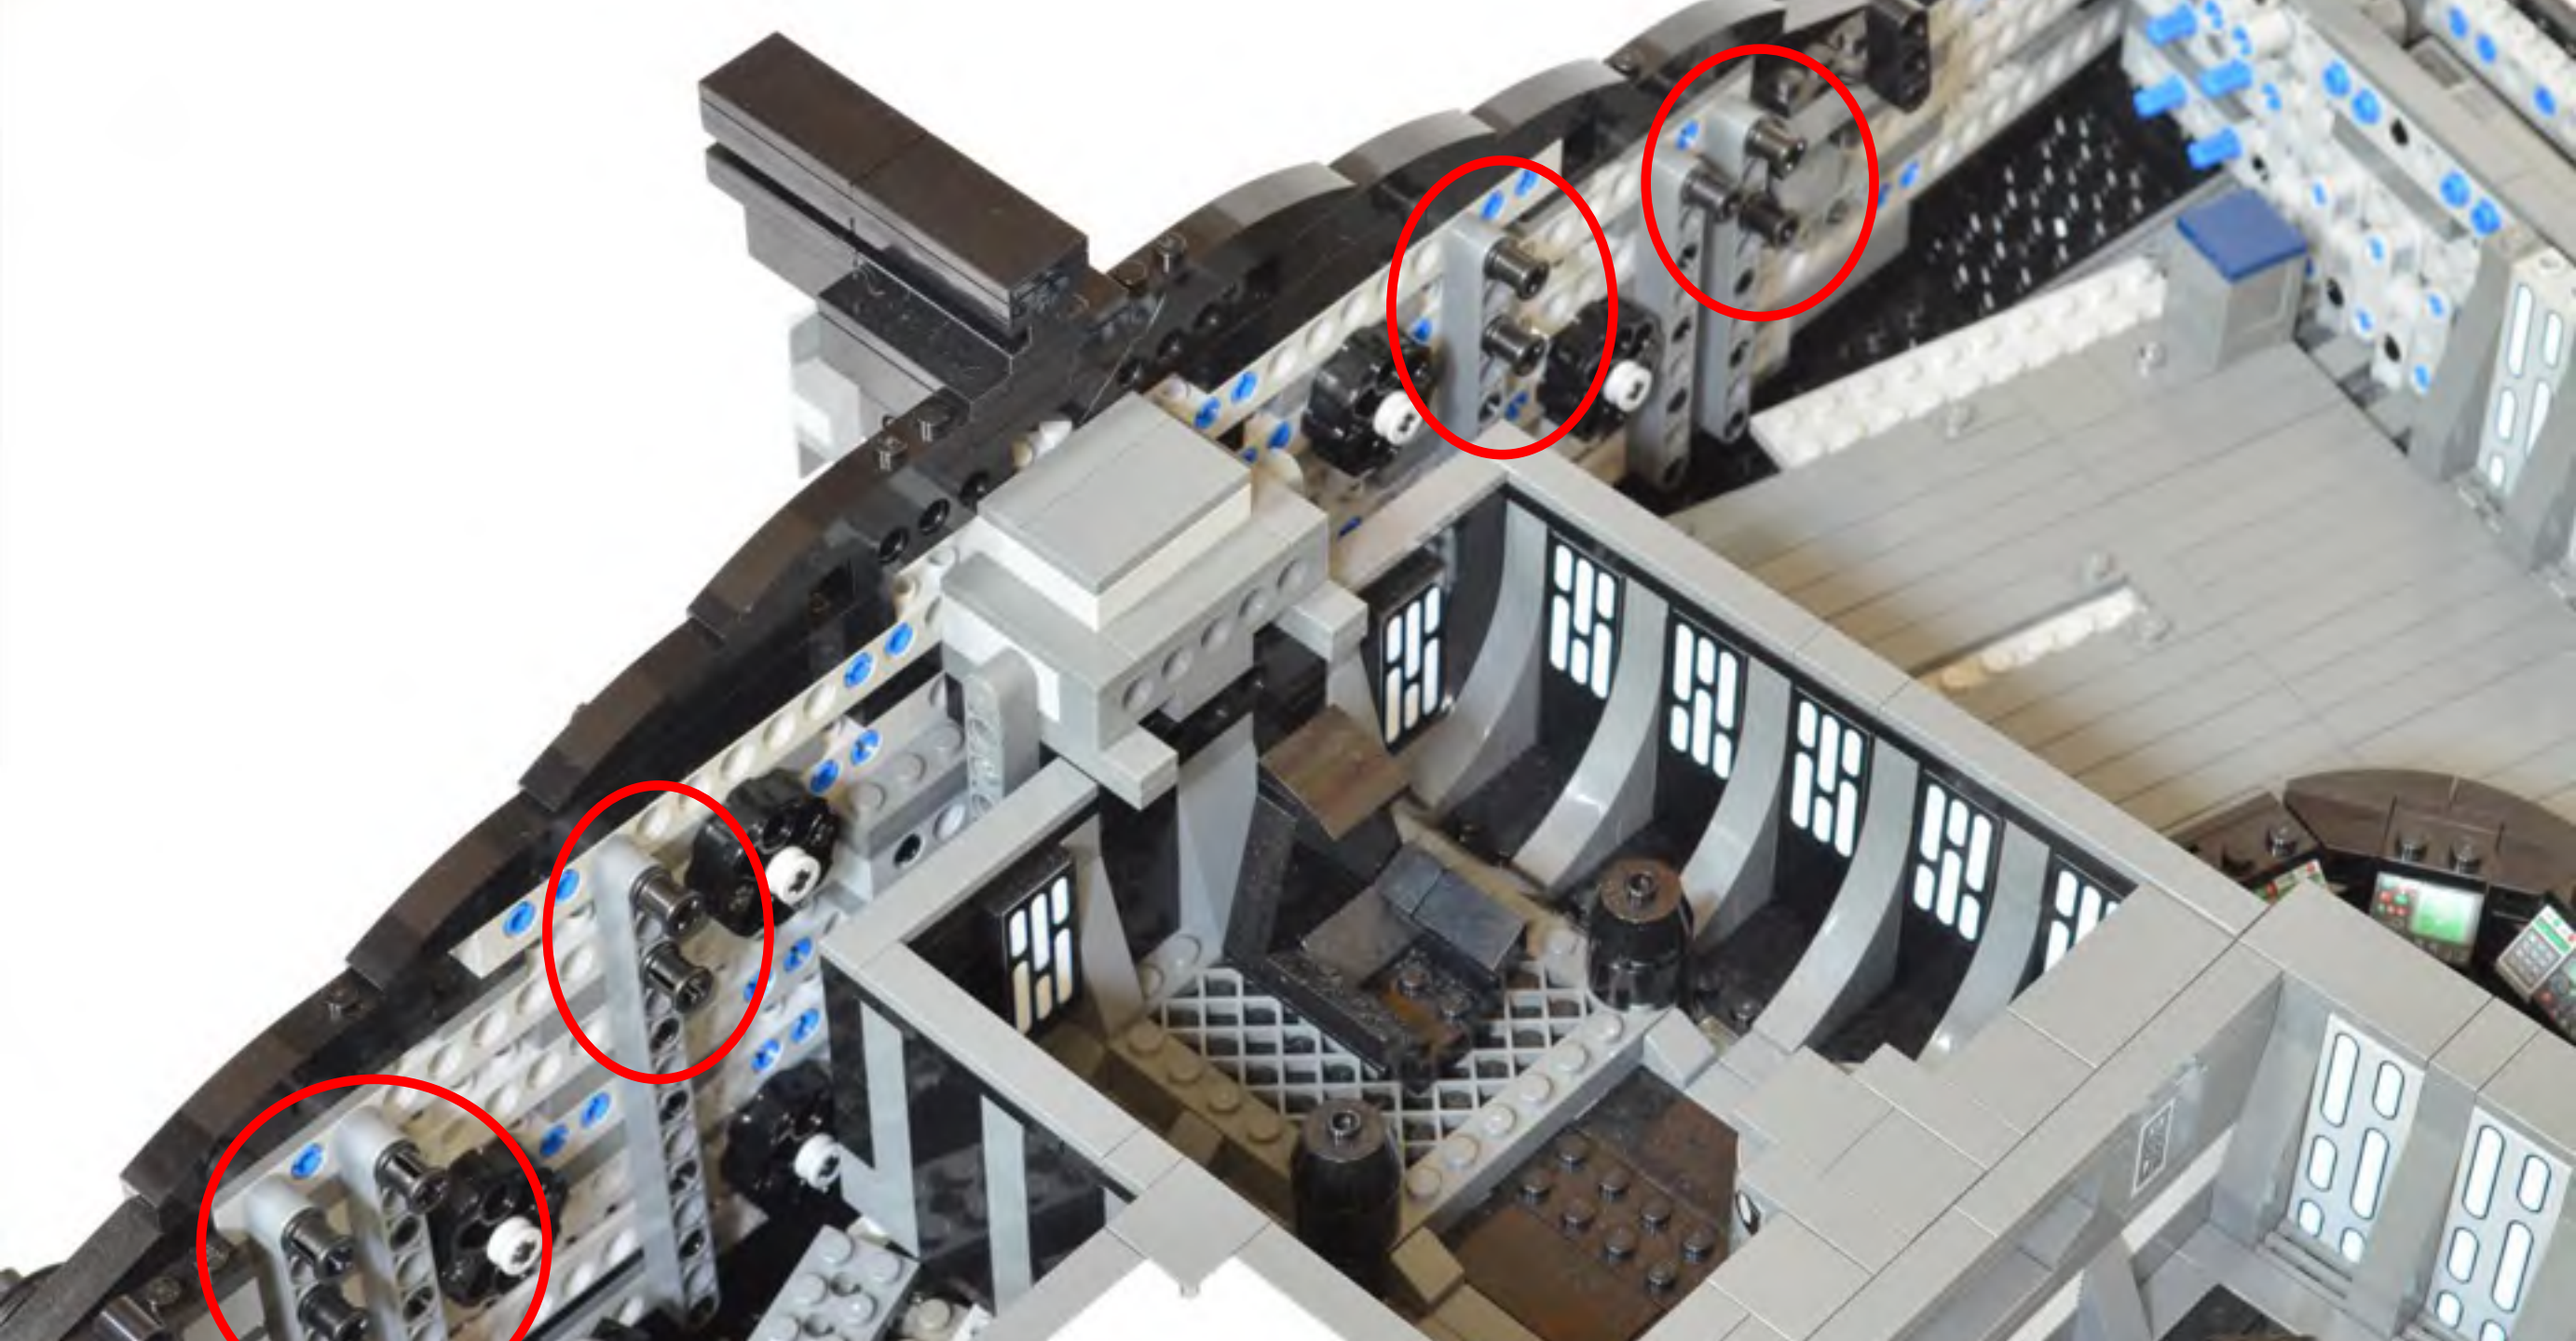


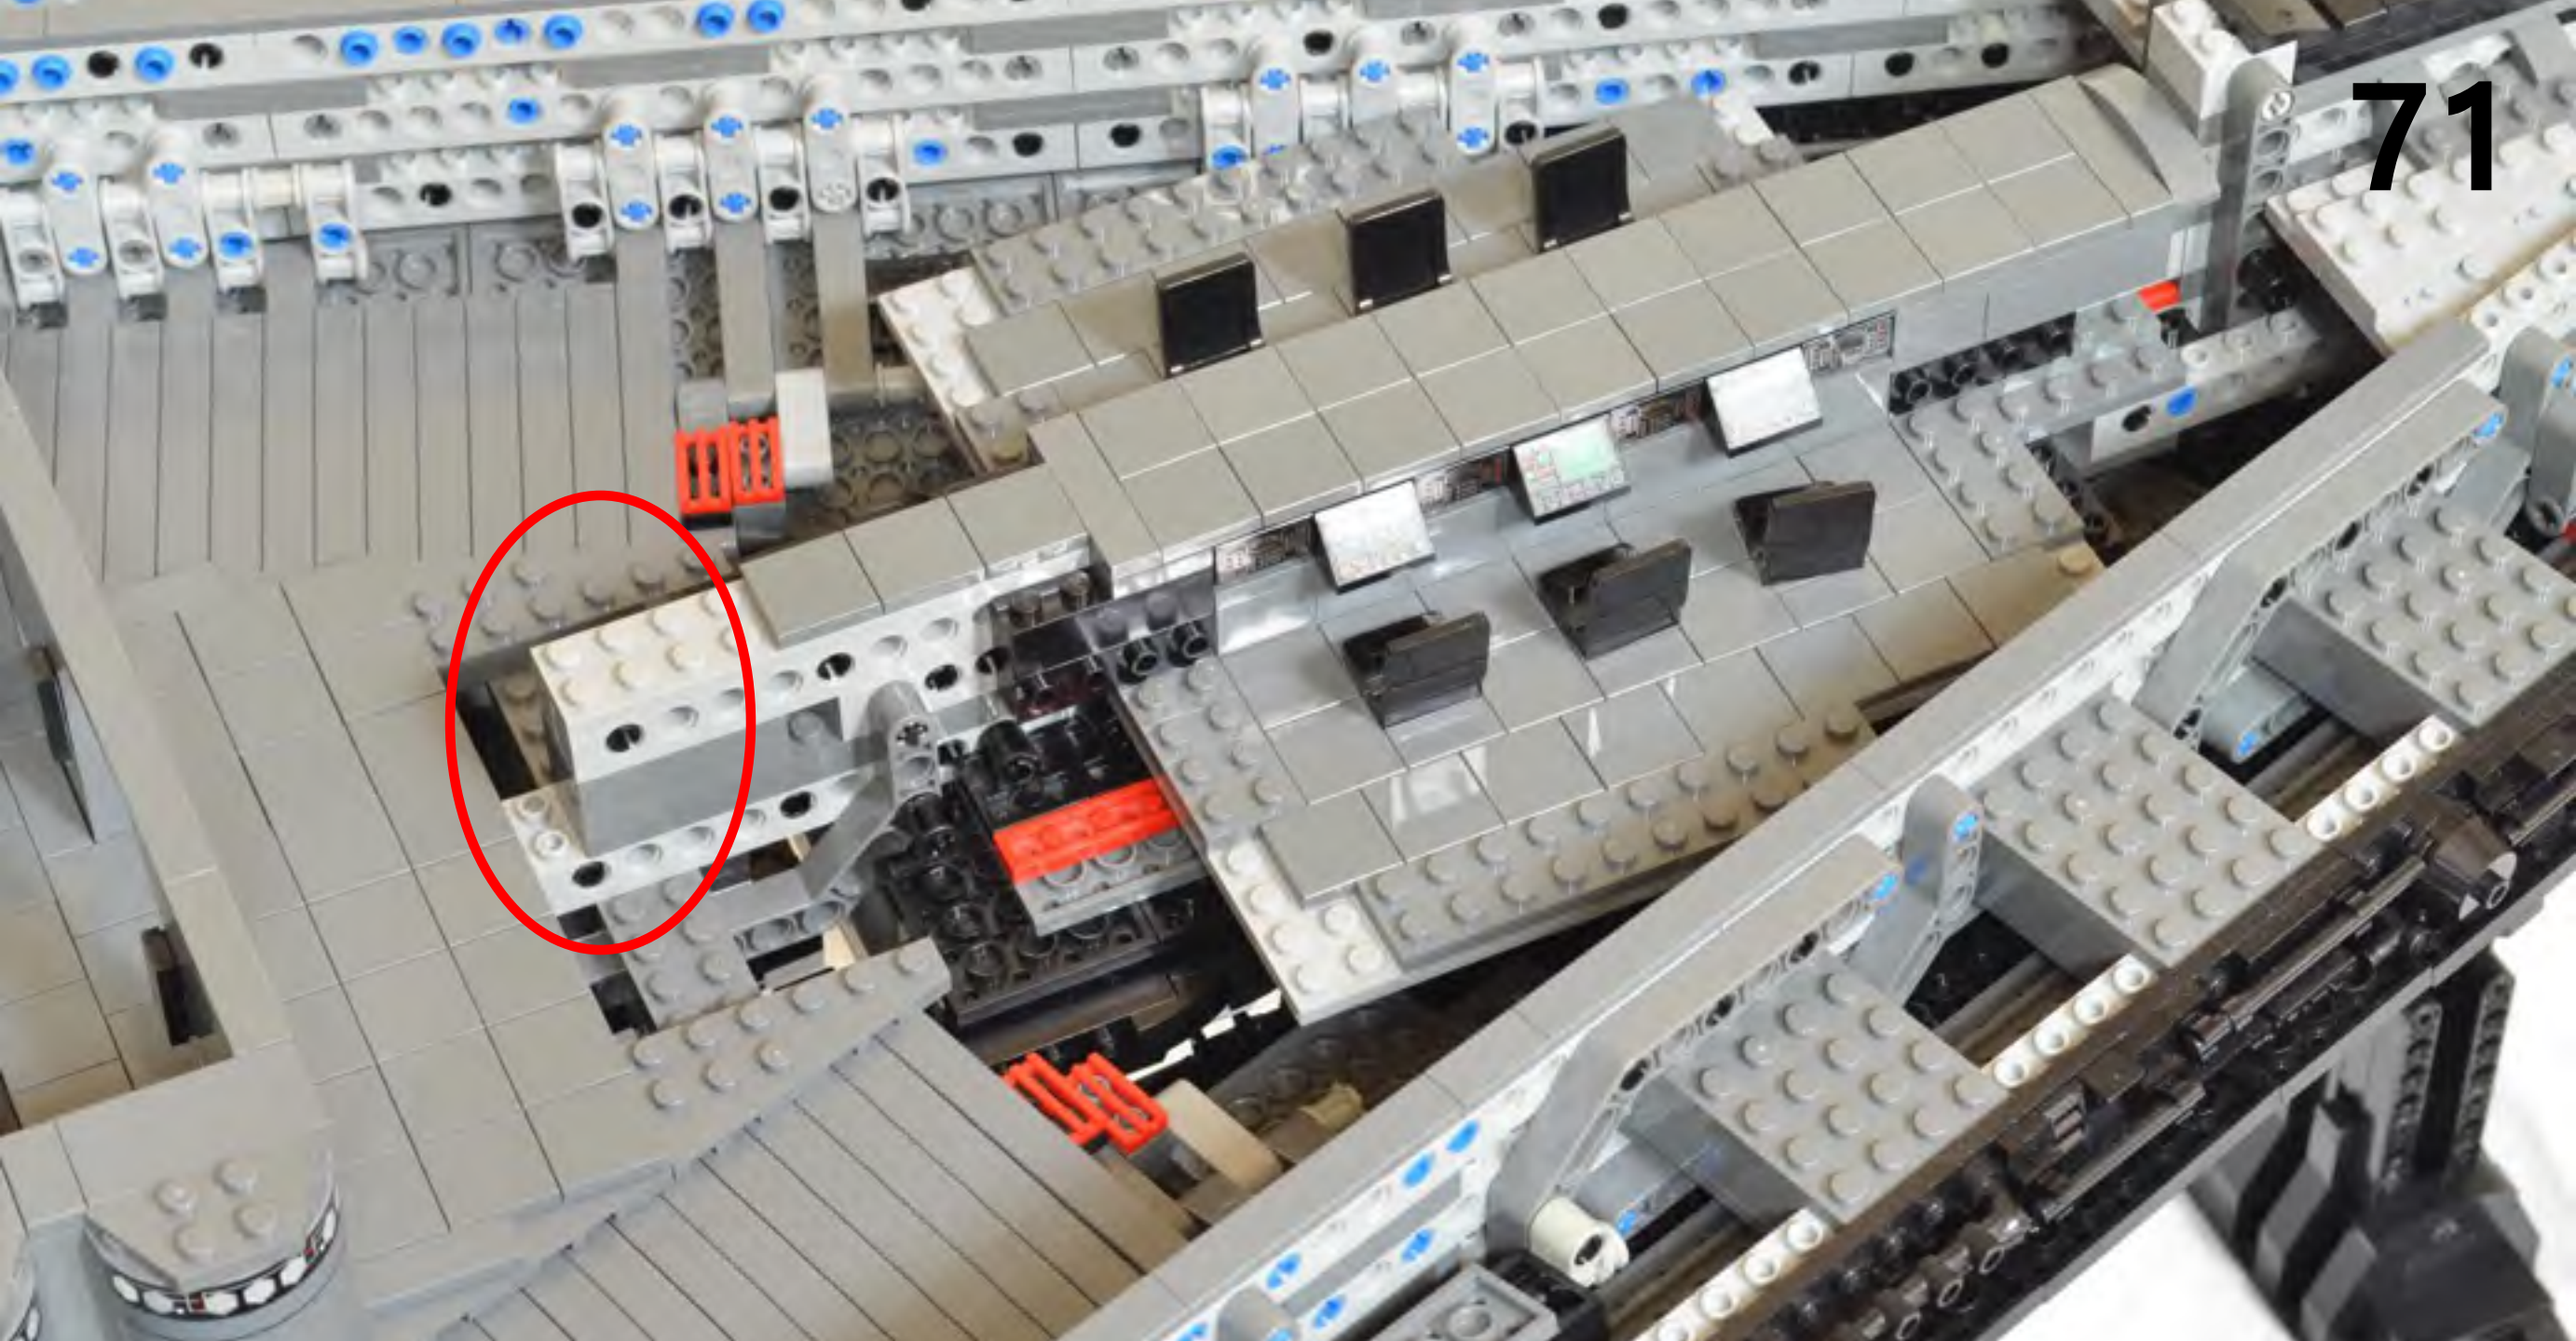
Insert one technic axle into the very top hole of the technic liftarm, and the other technic axle into the third hole down. Both pins should go through the technic bricks in the center, which will hold them snugly in place.

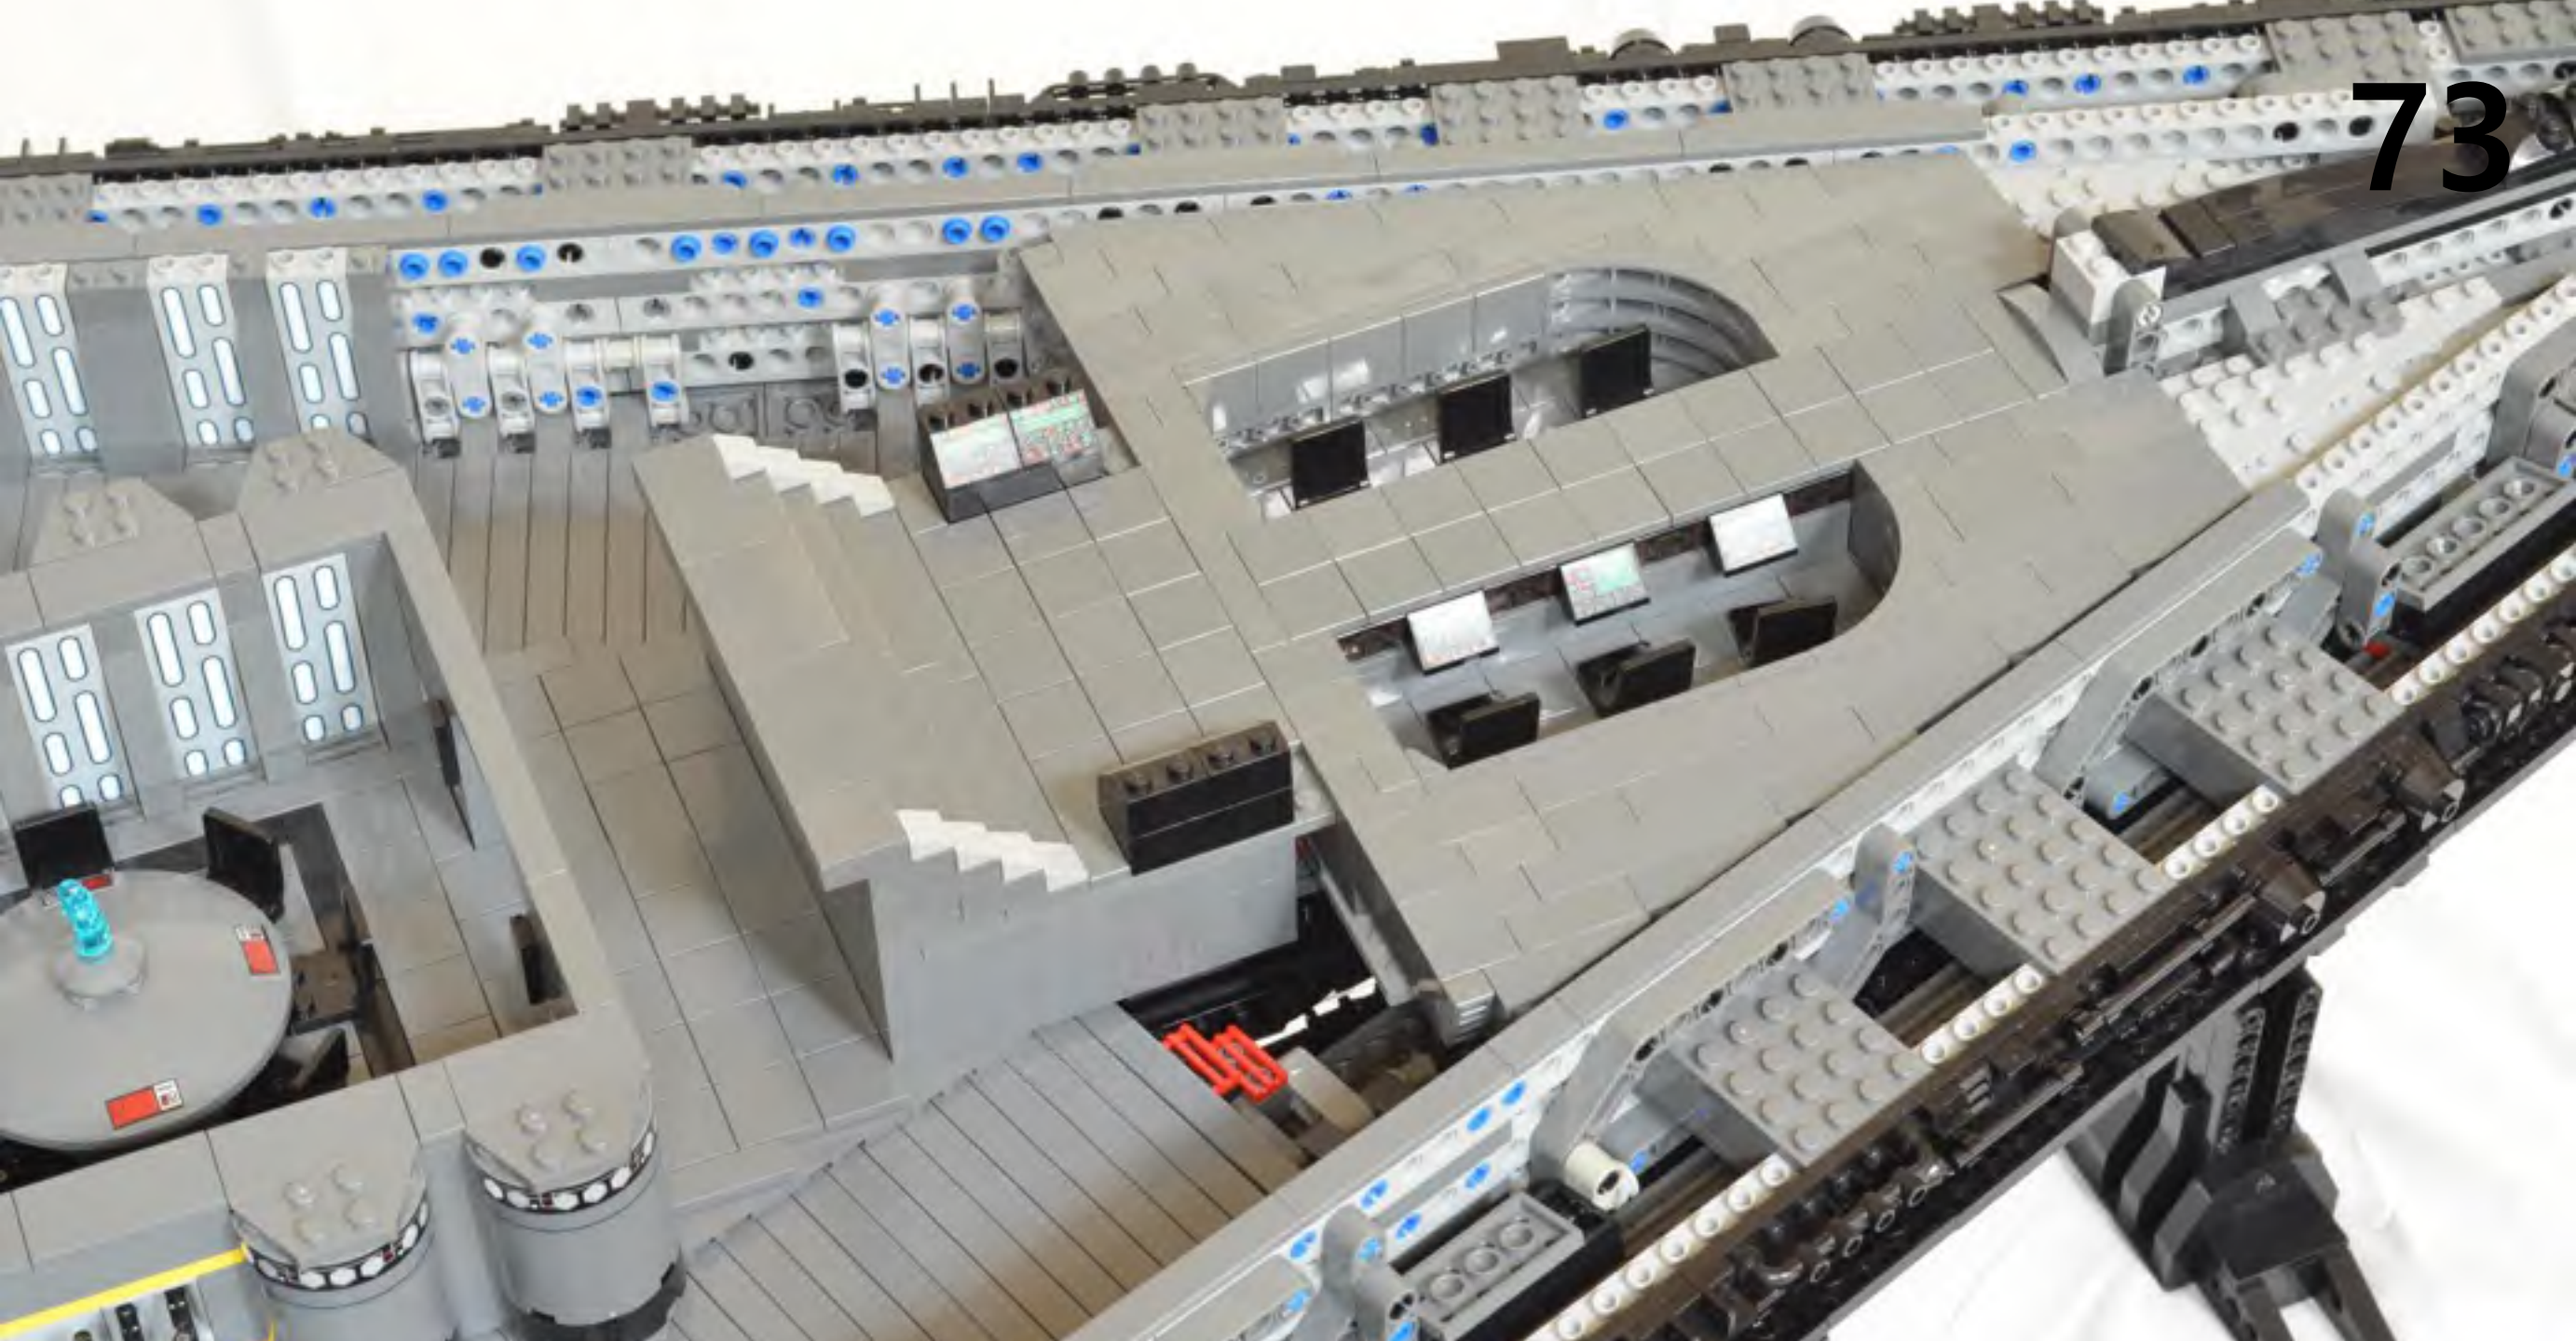


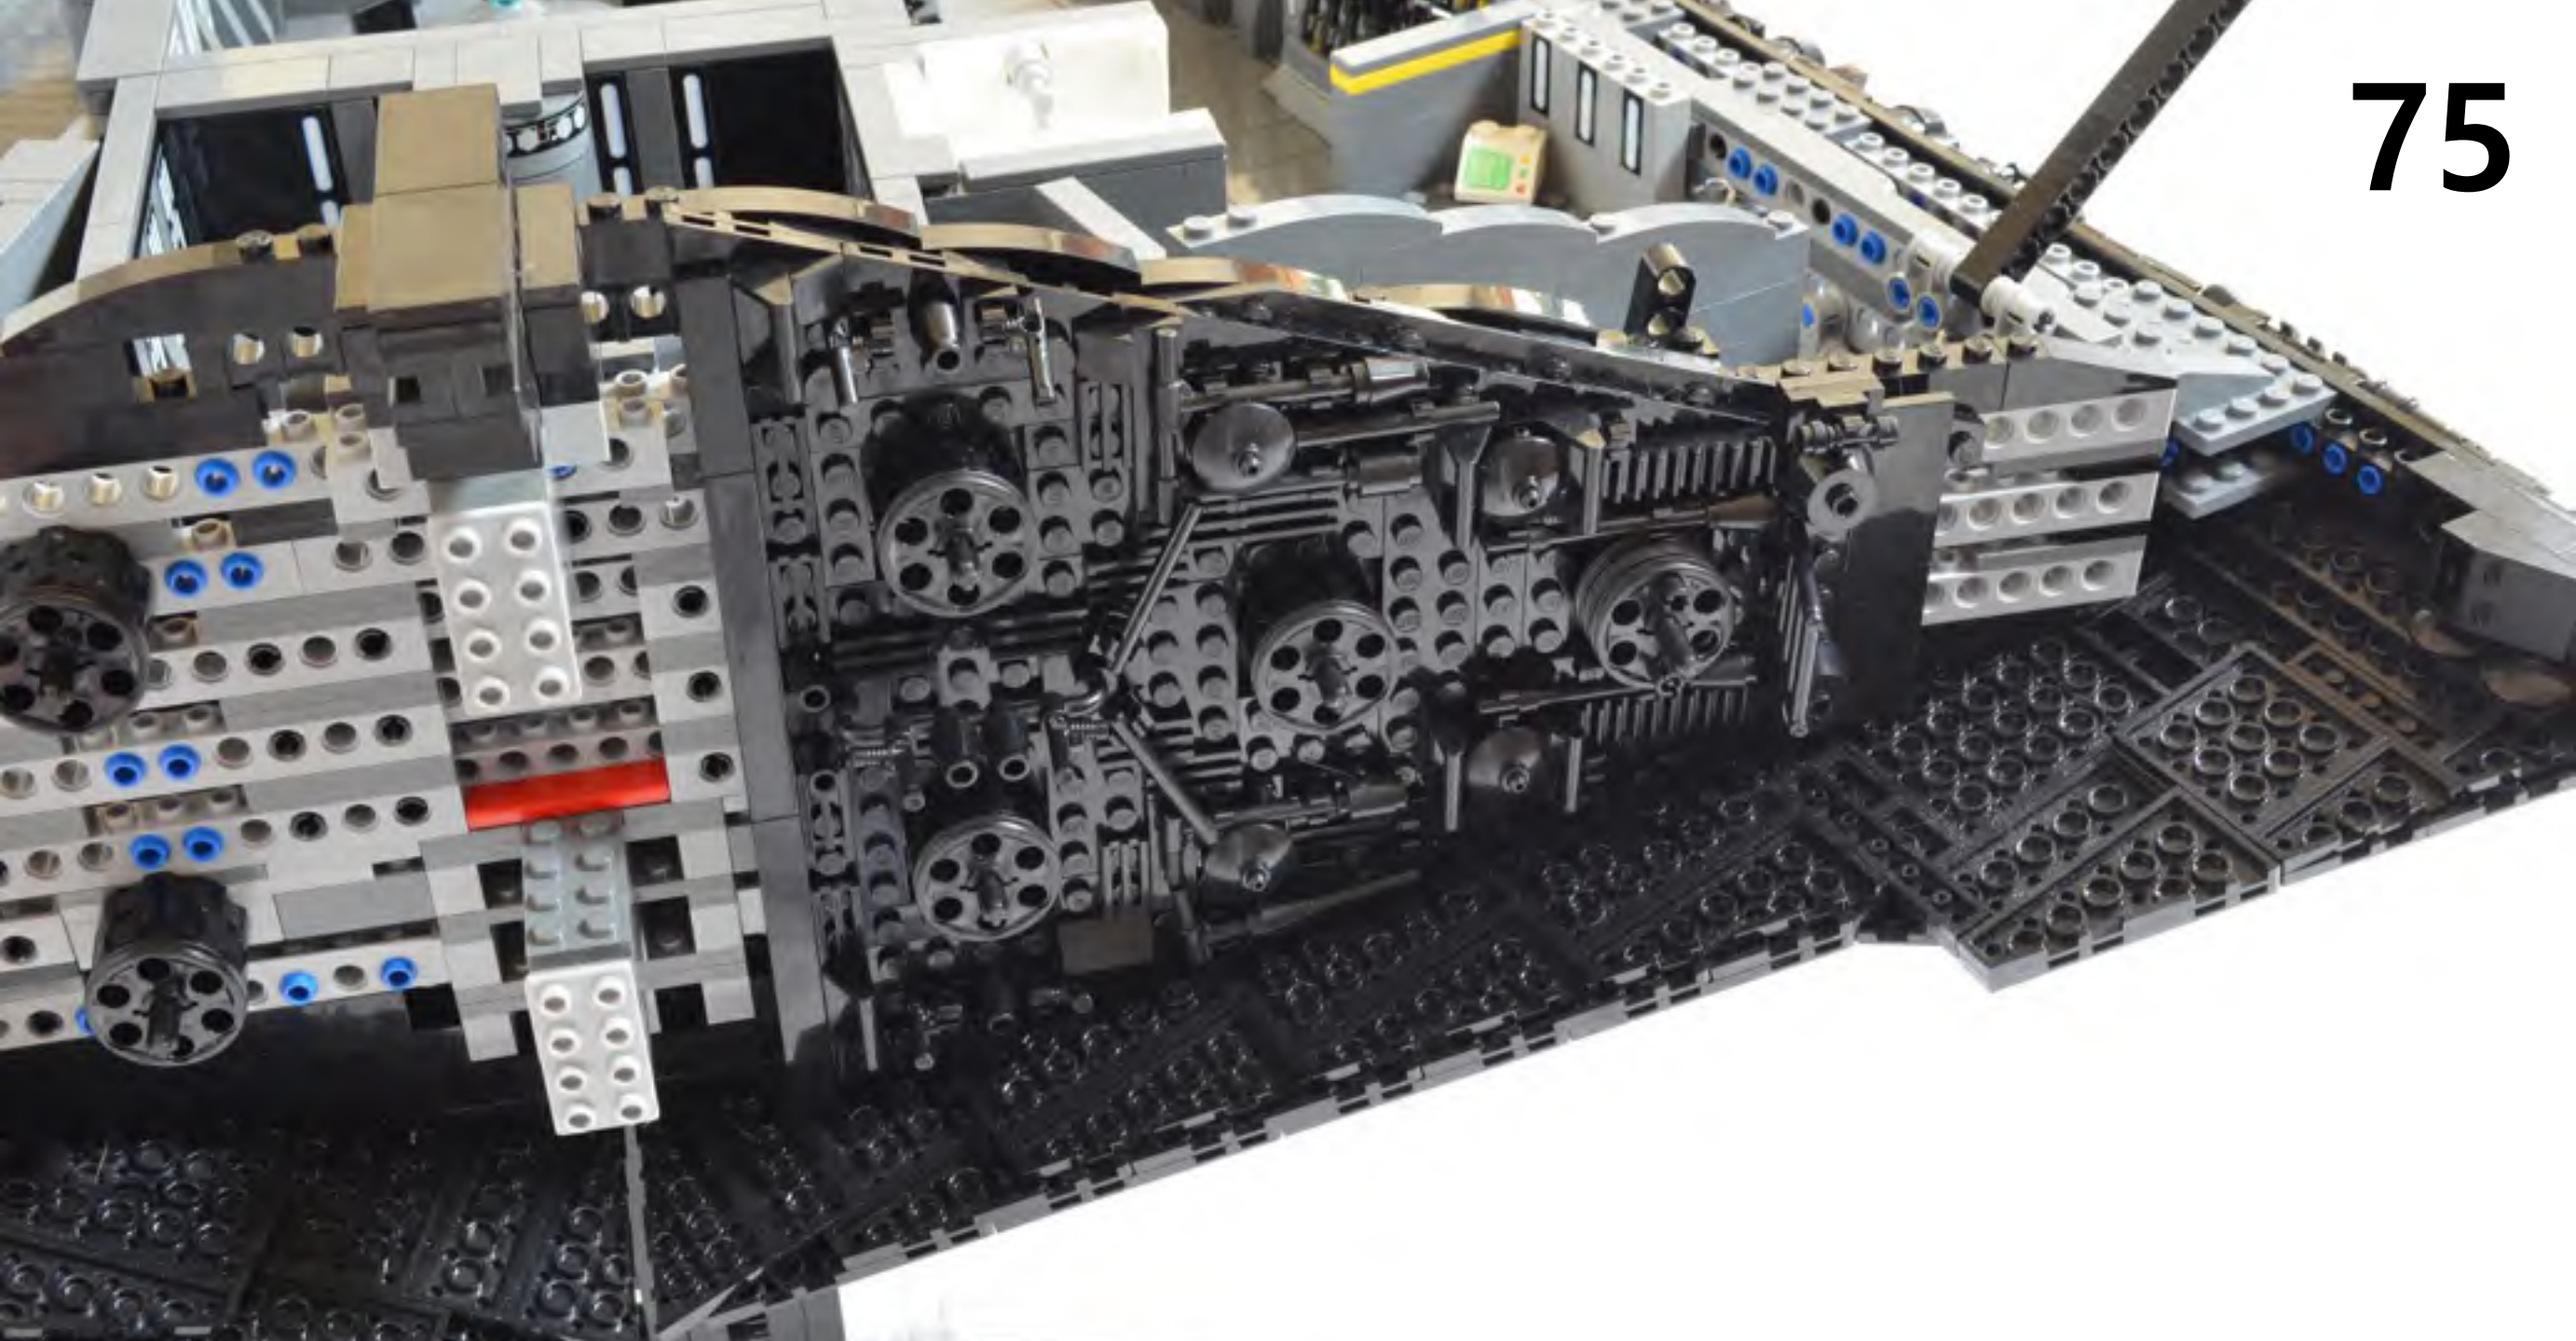
Fully depress all ten technic pins (five on each side).

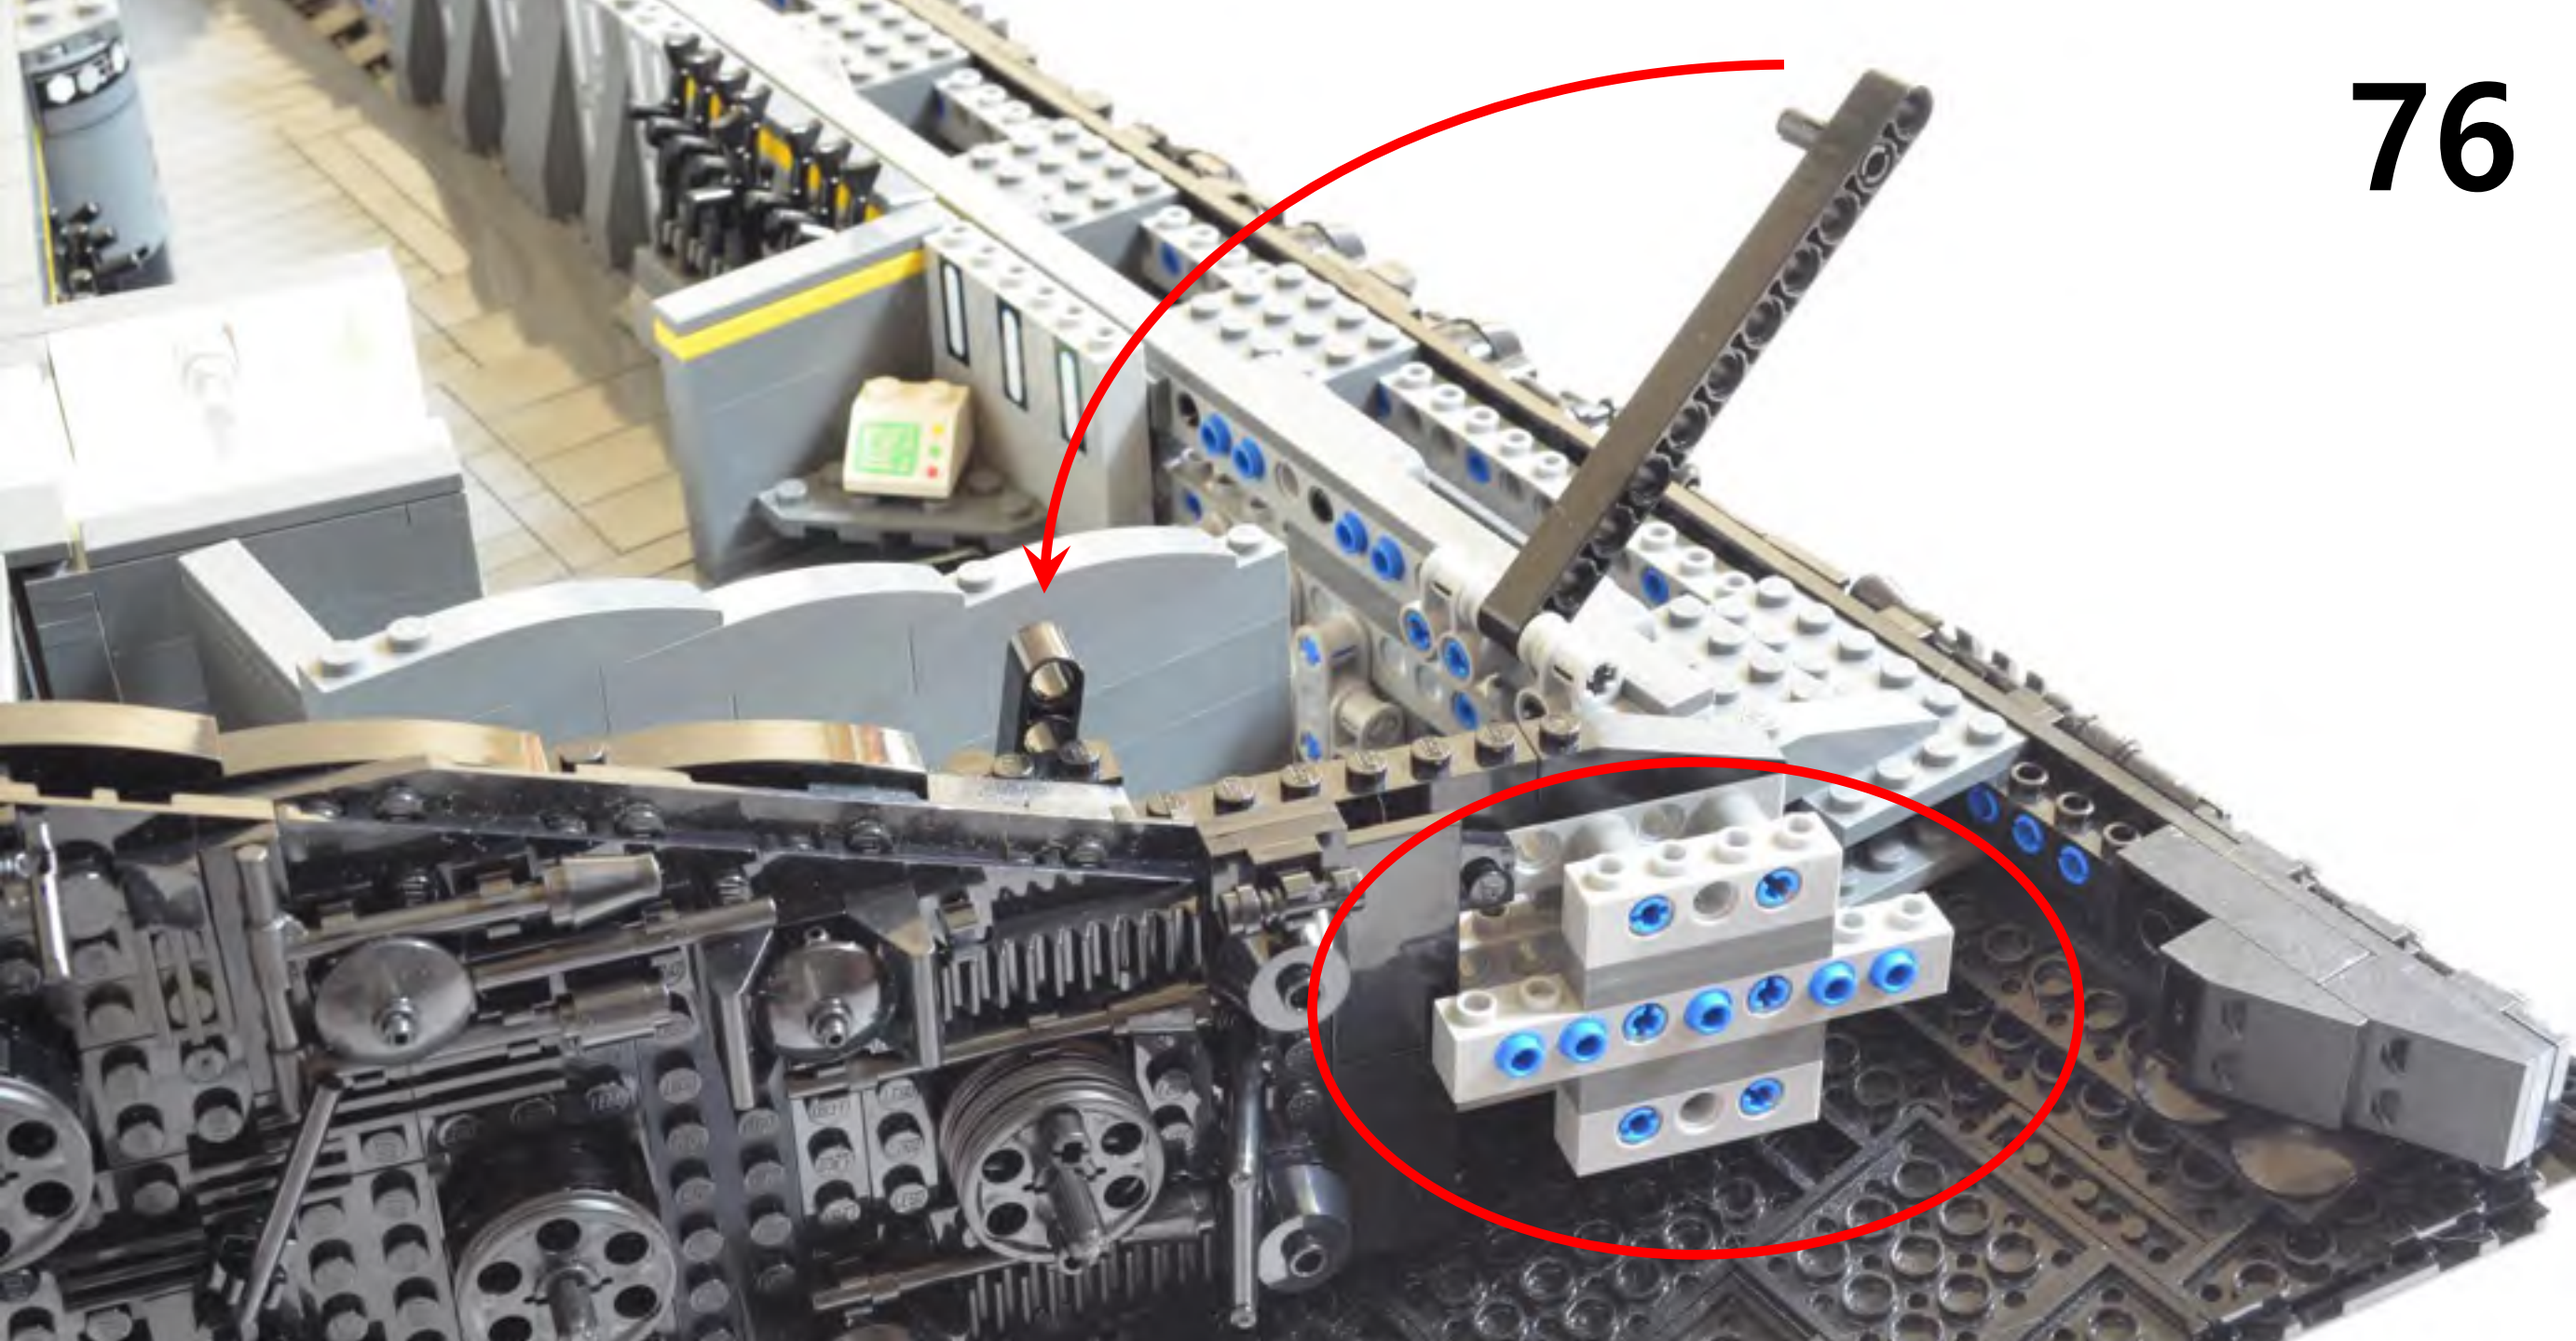


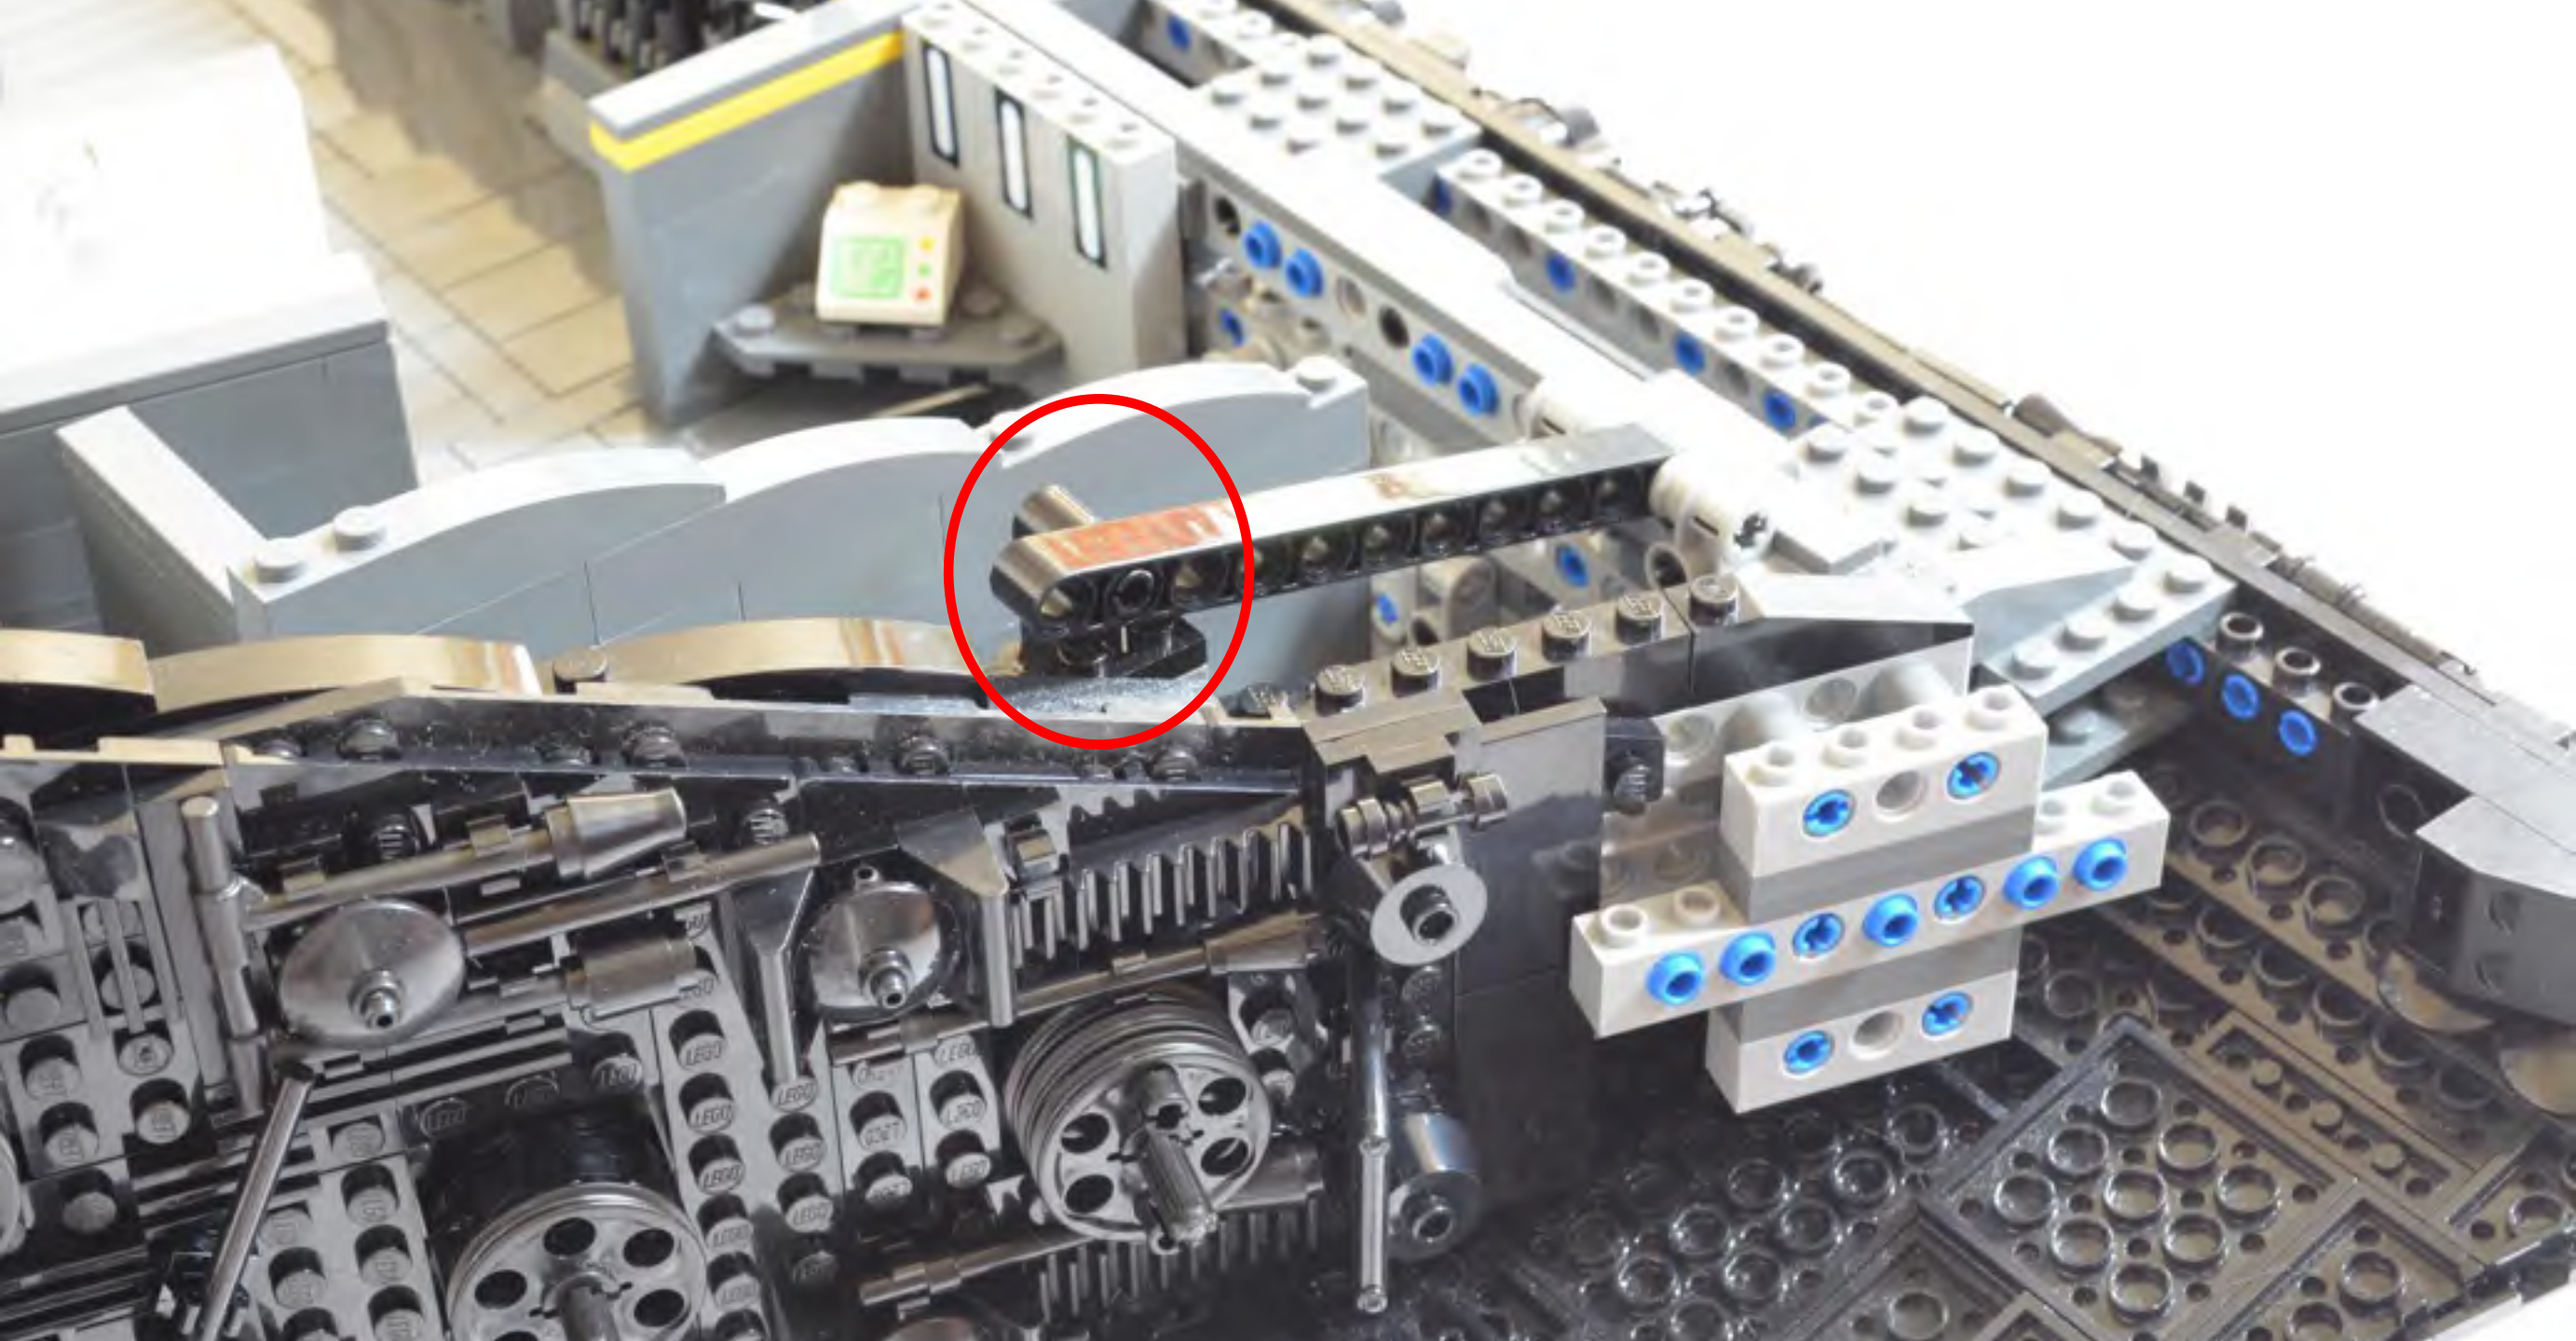


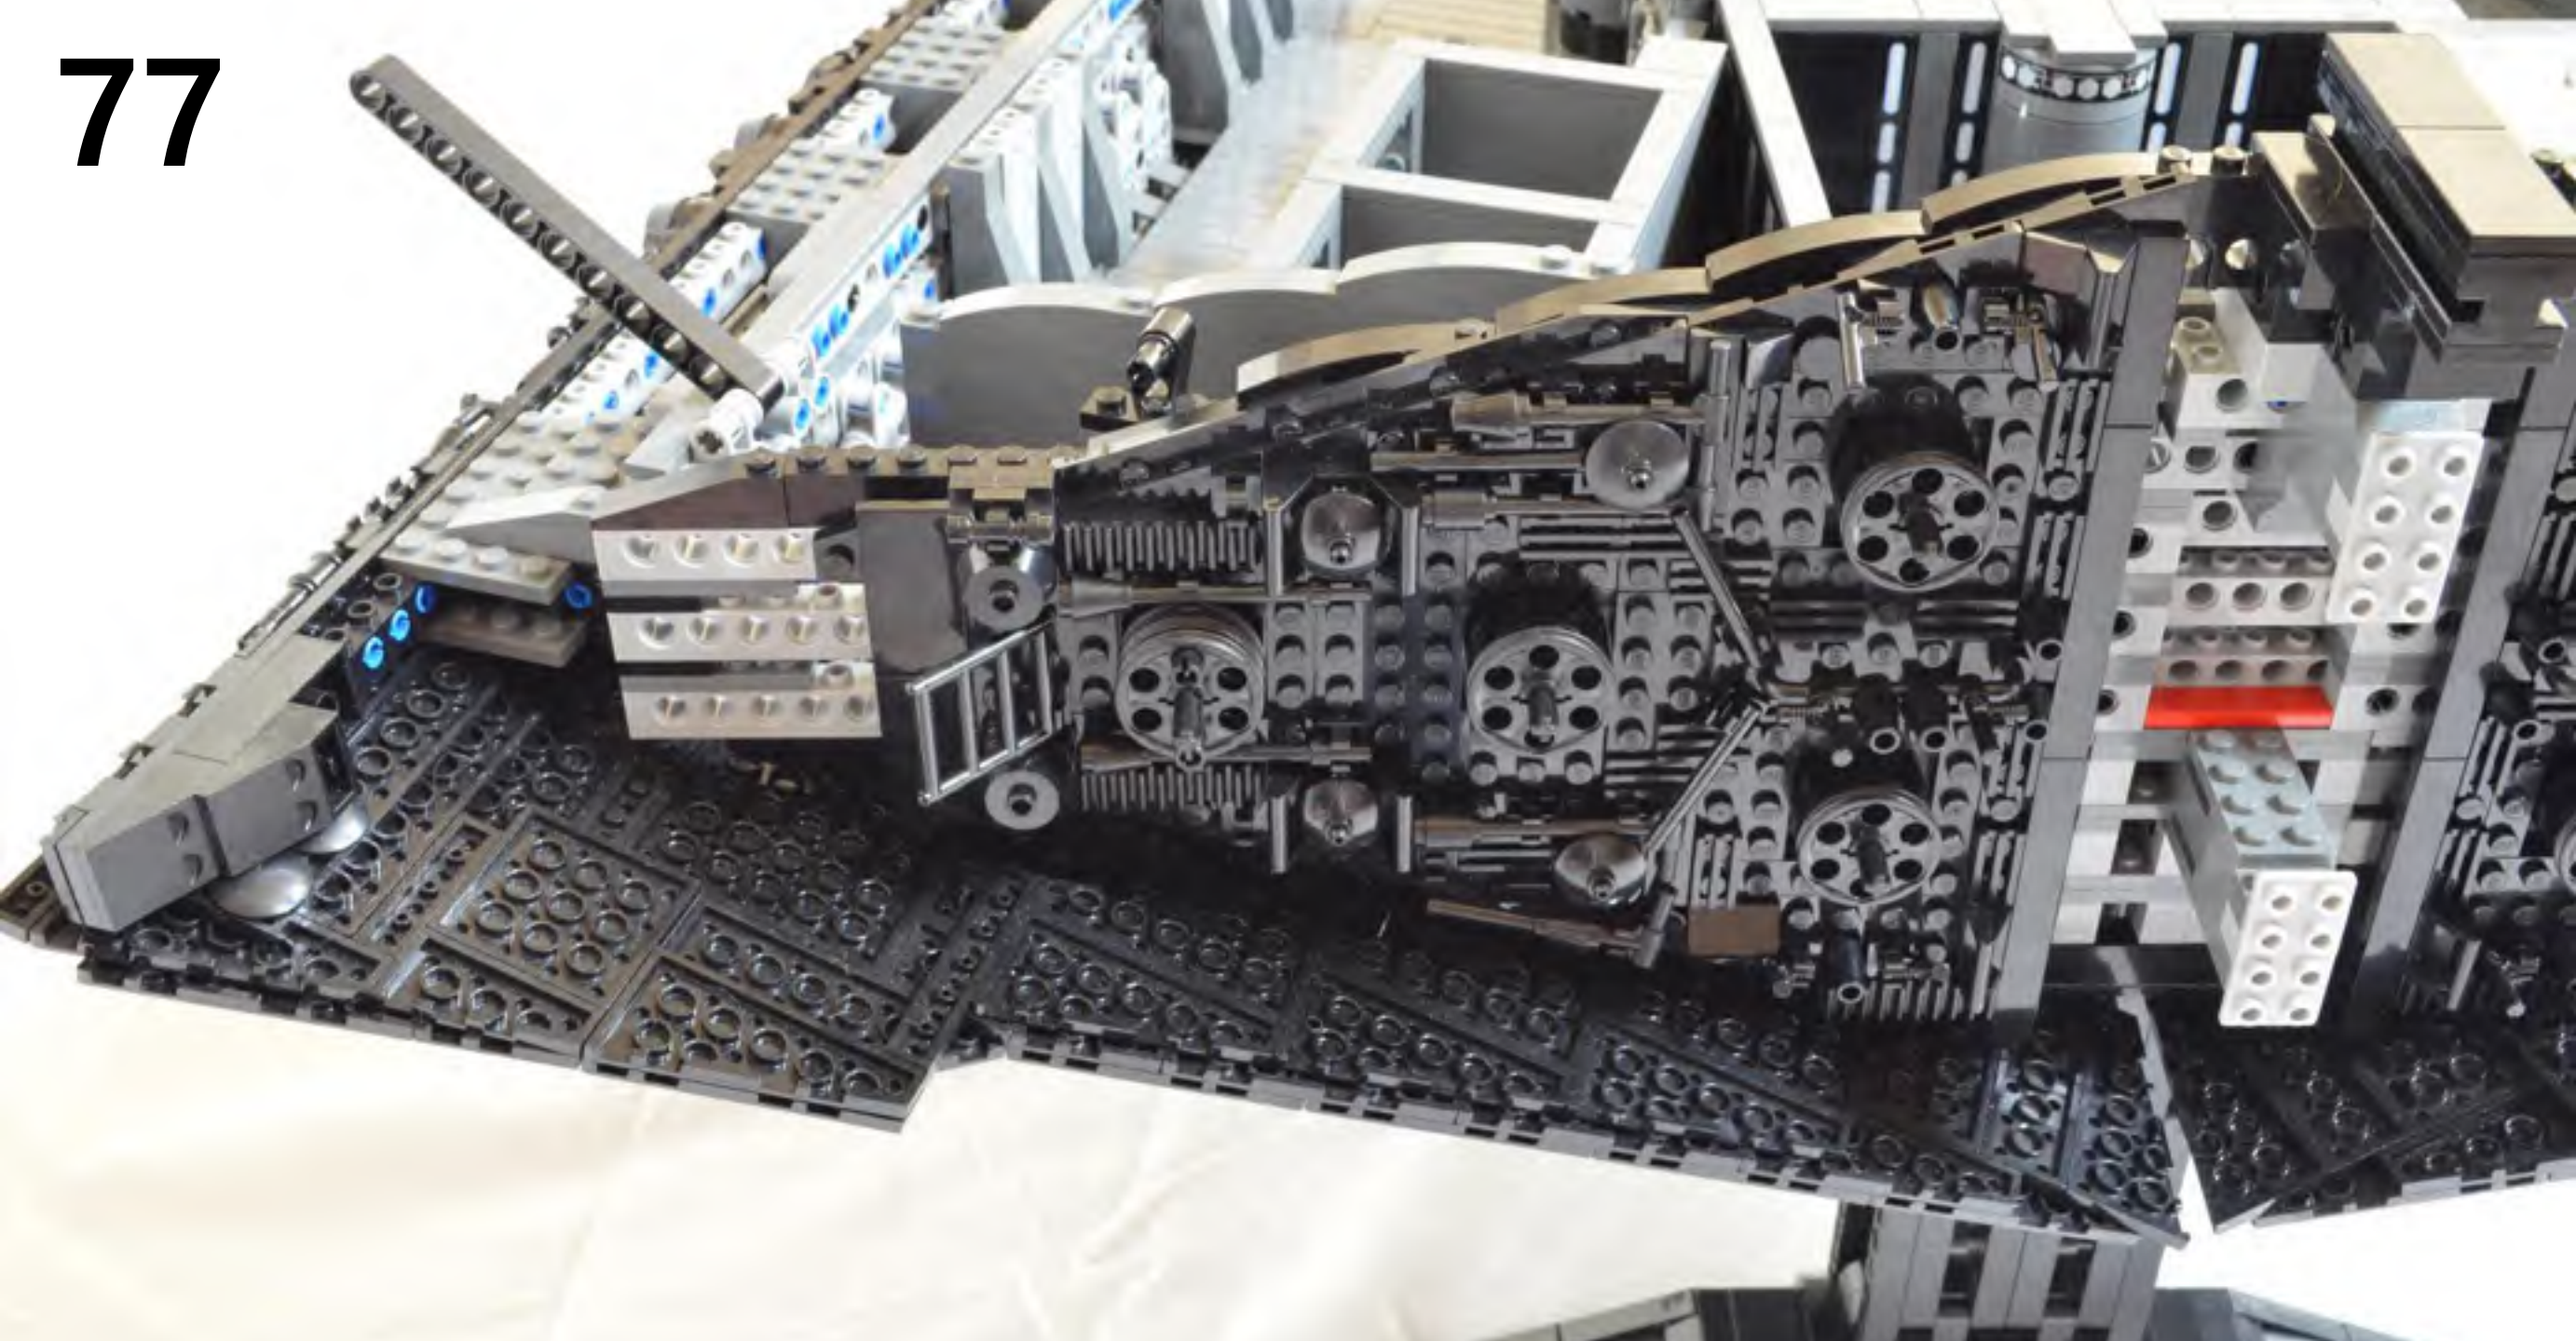


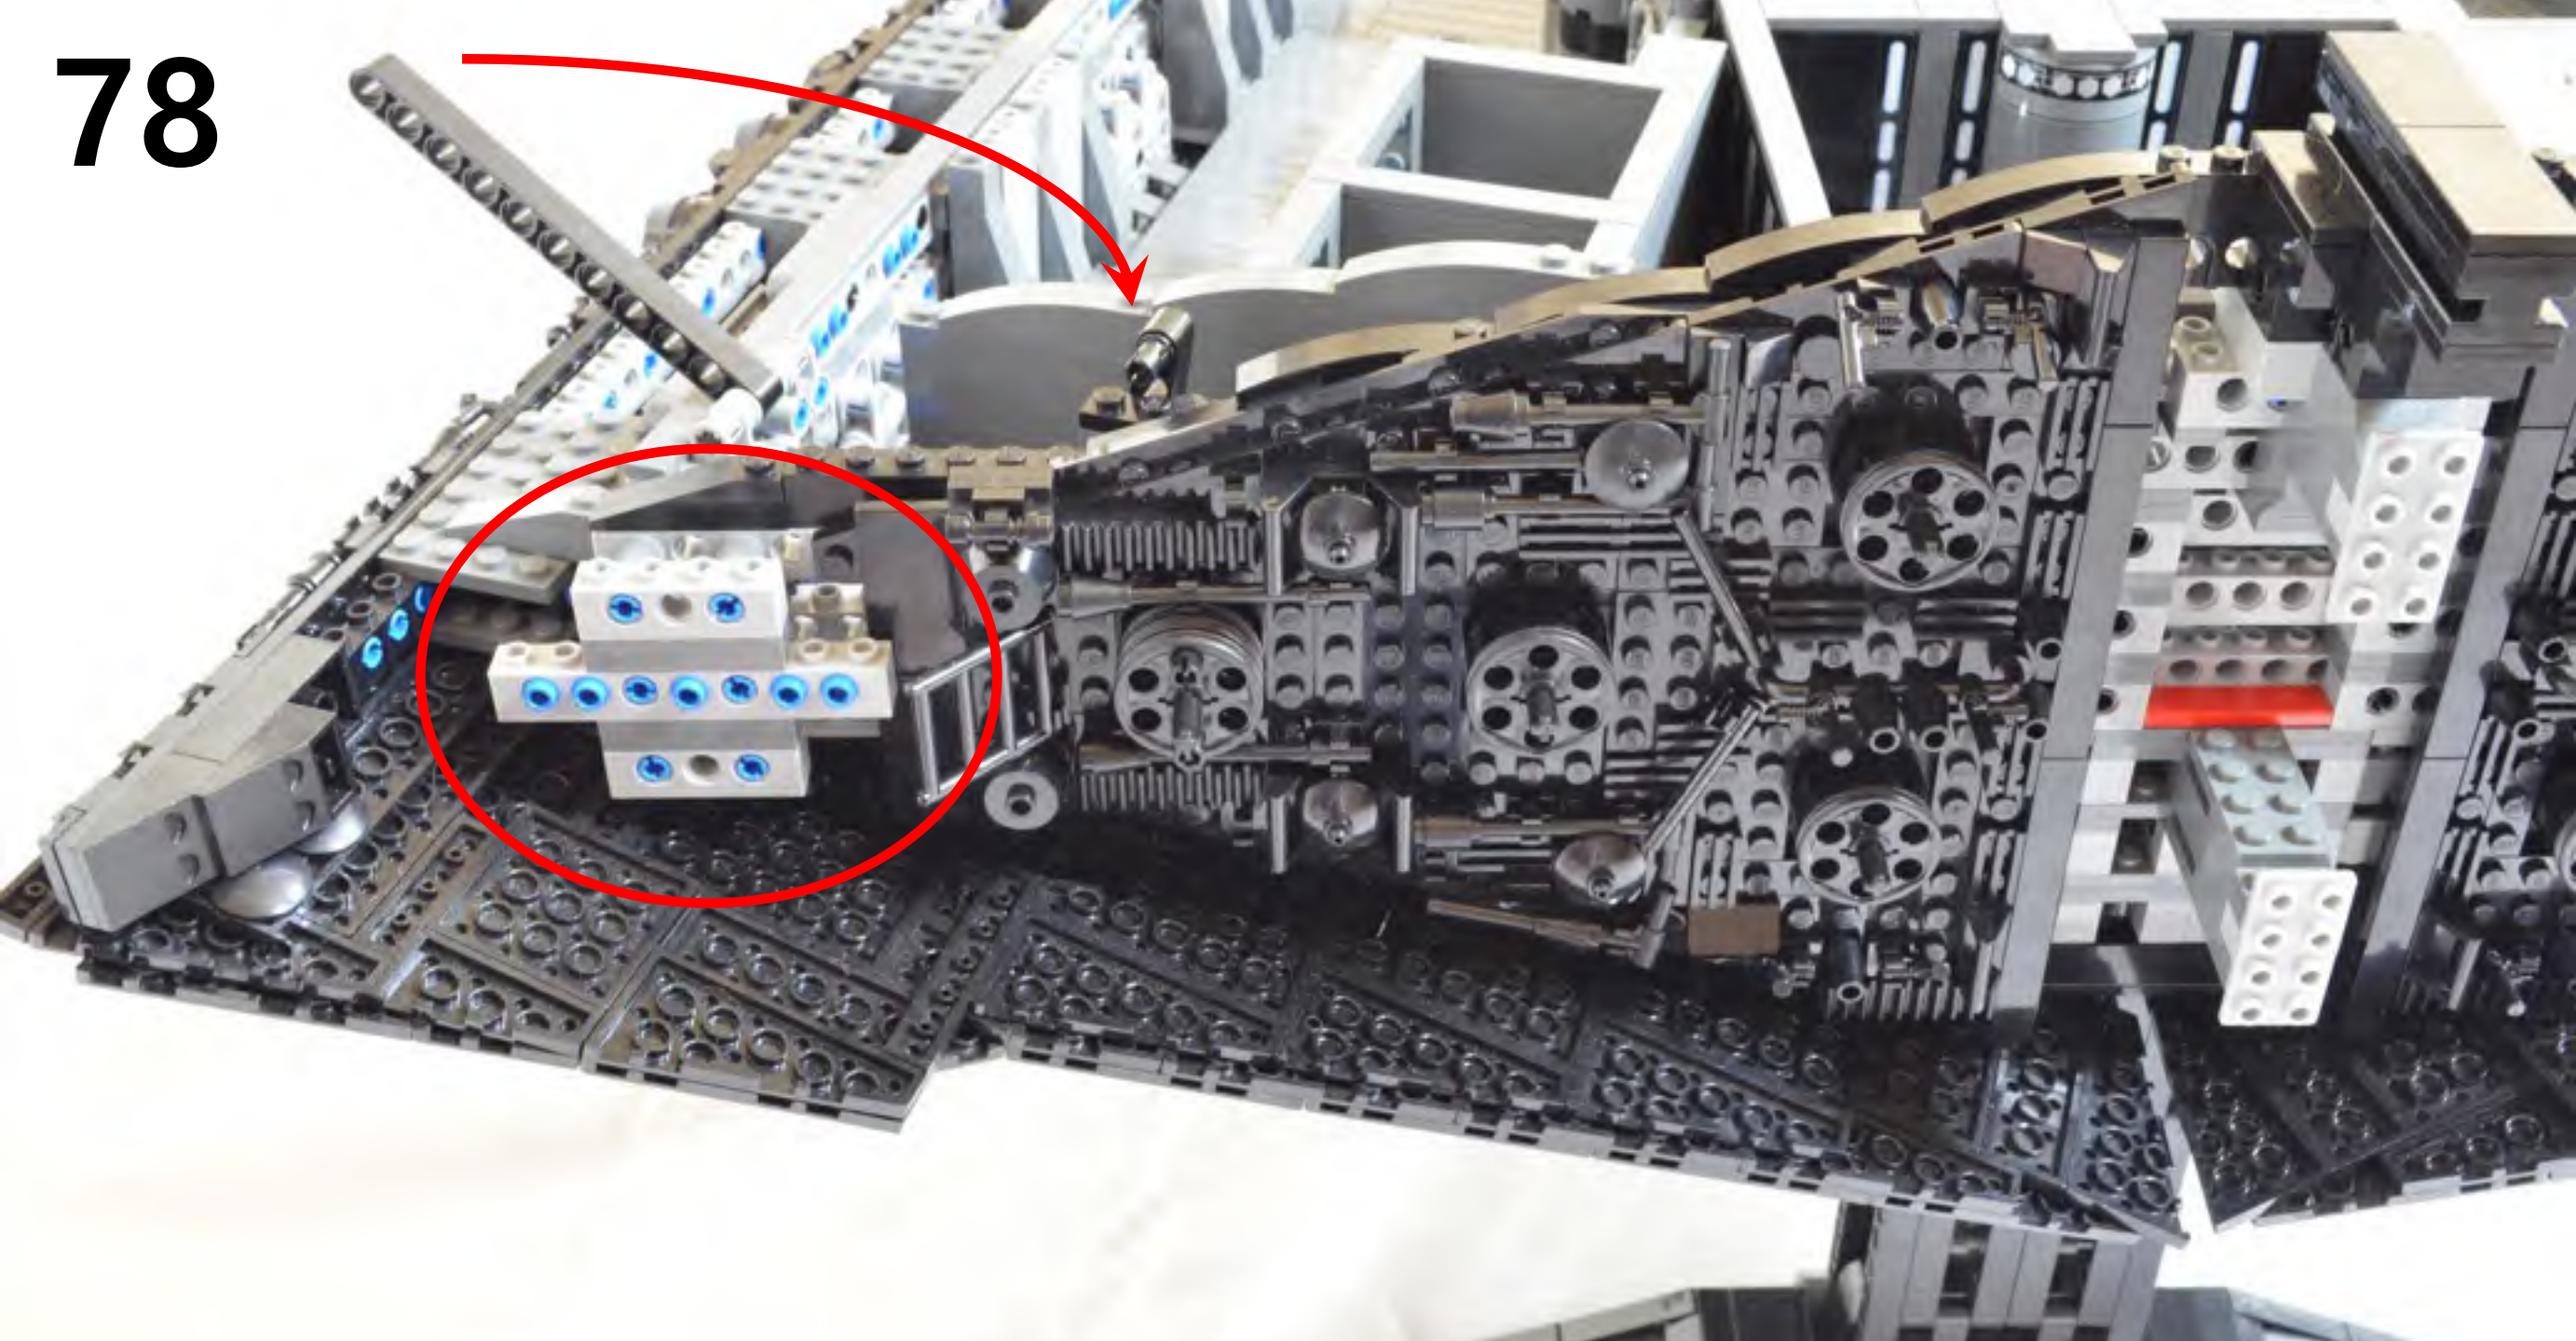






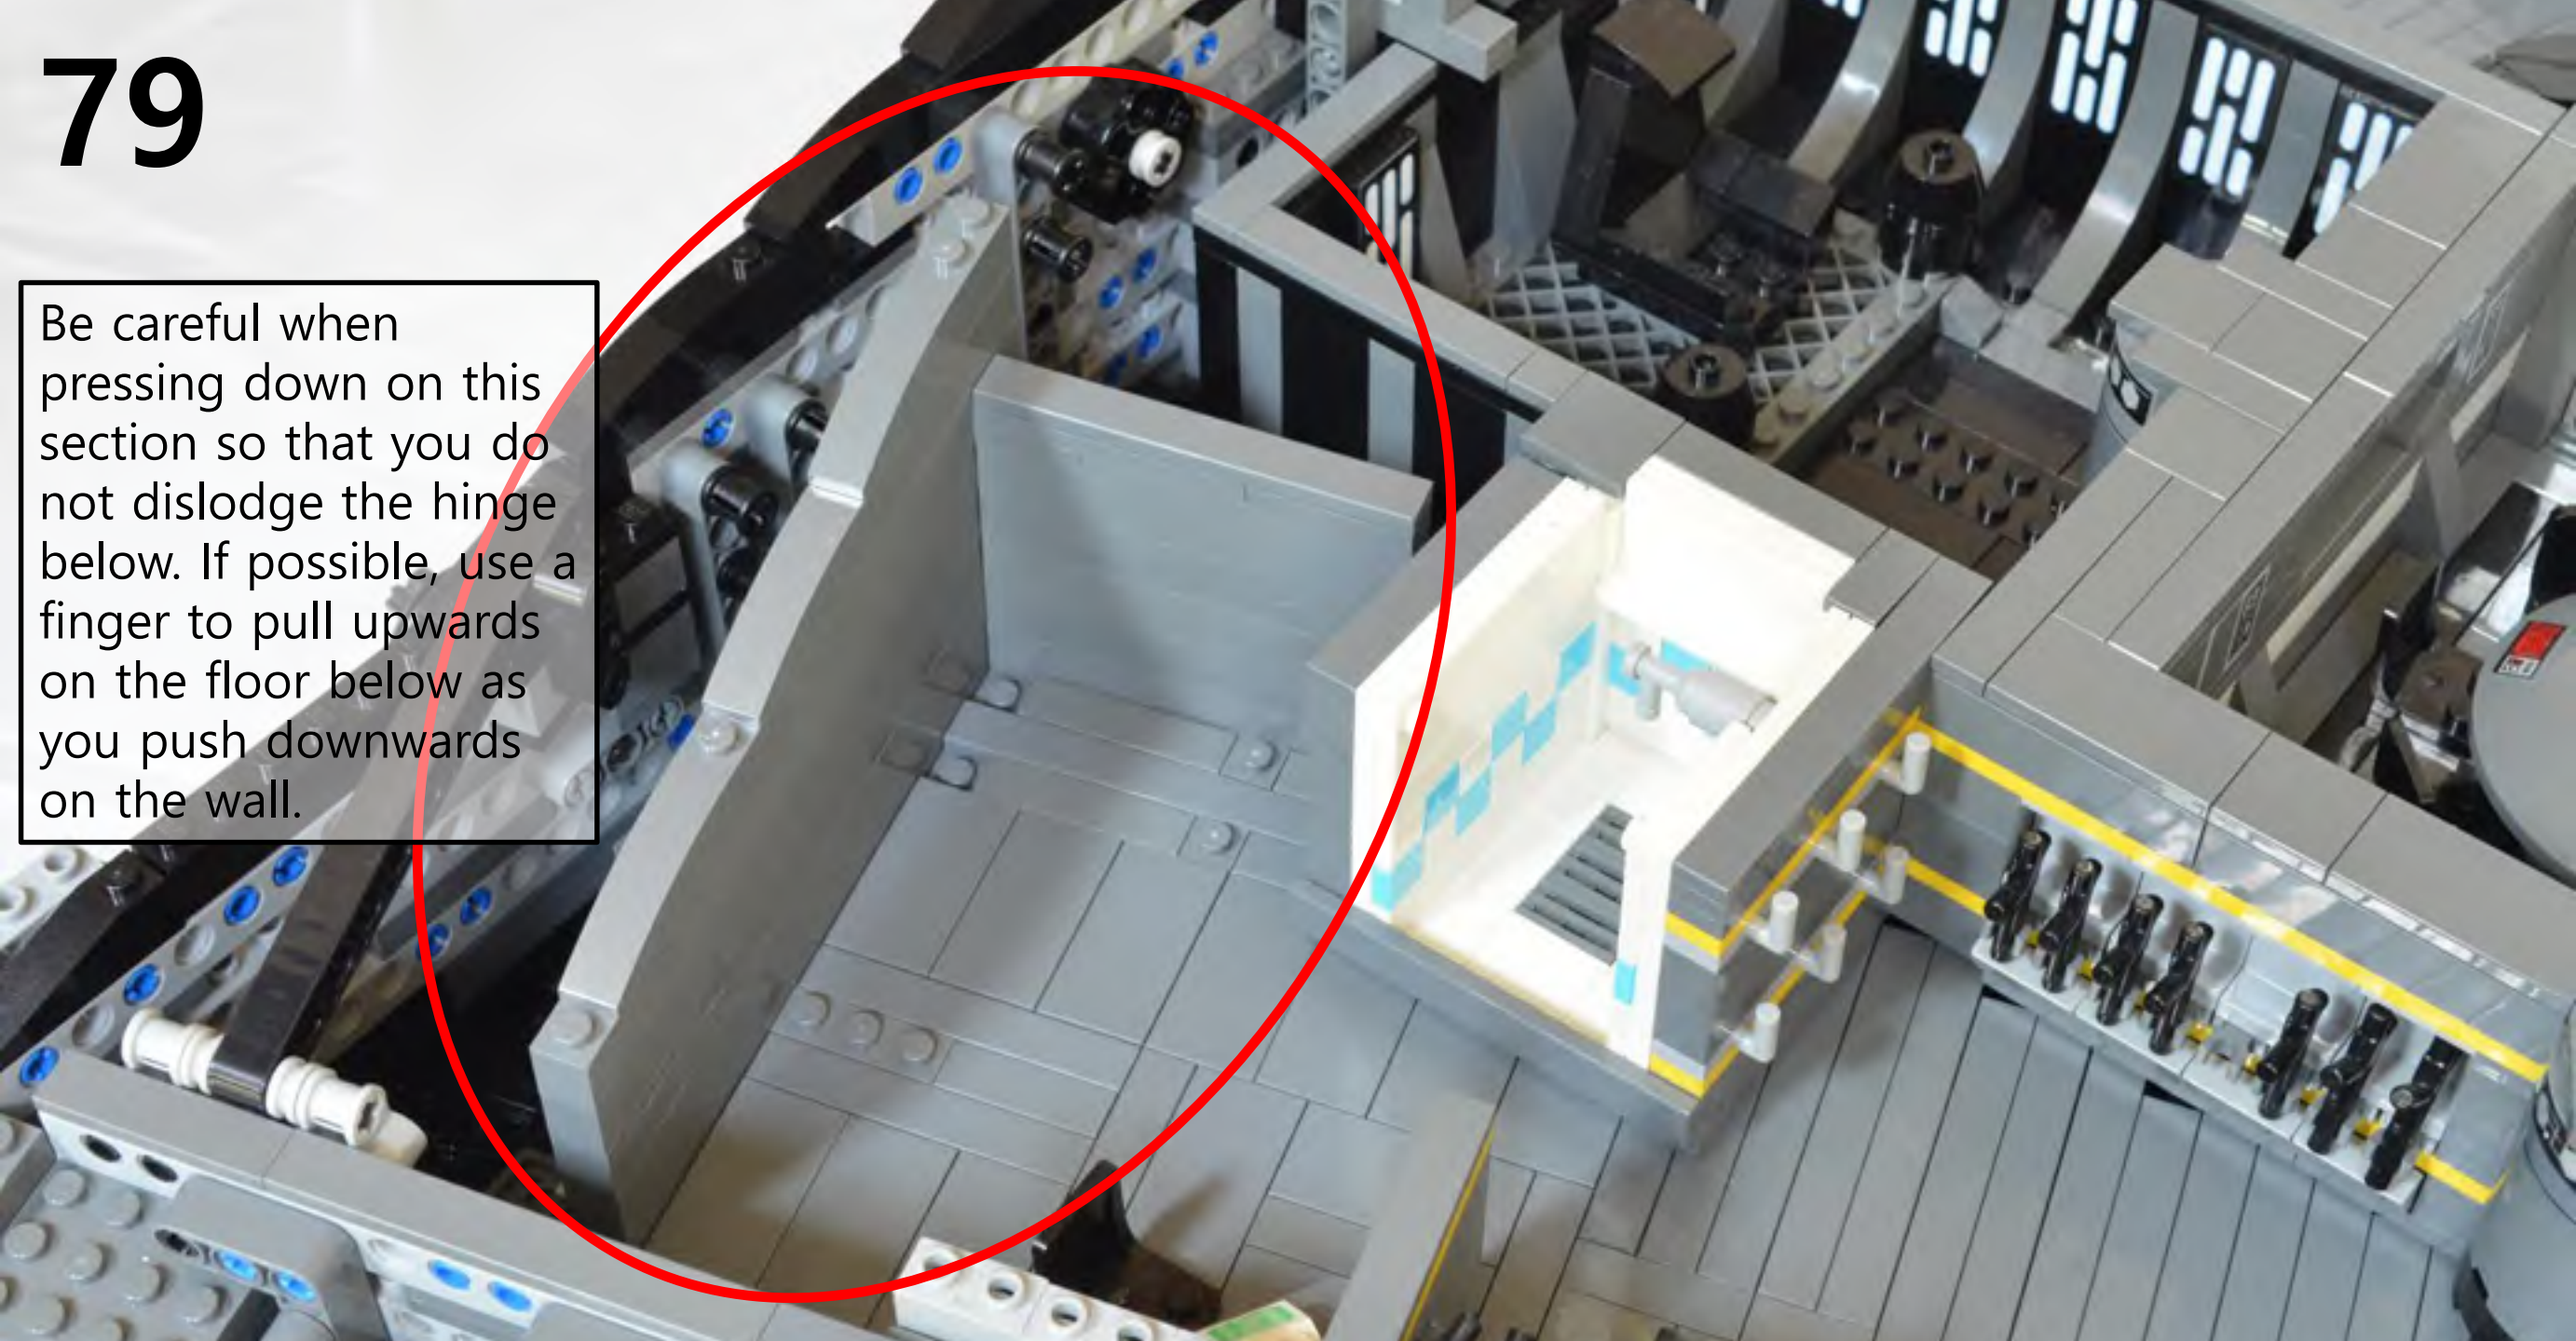


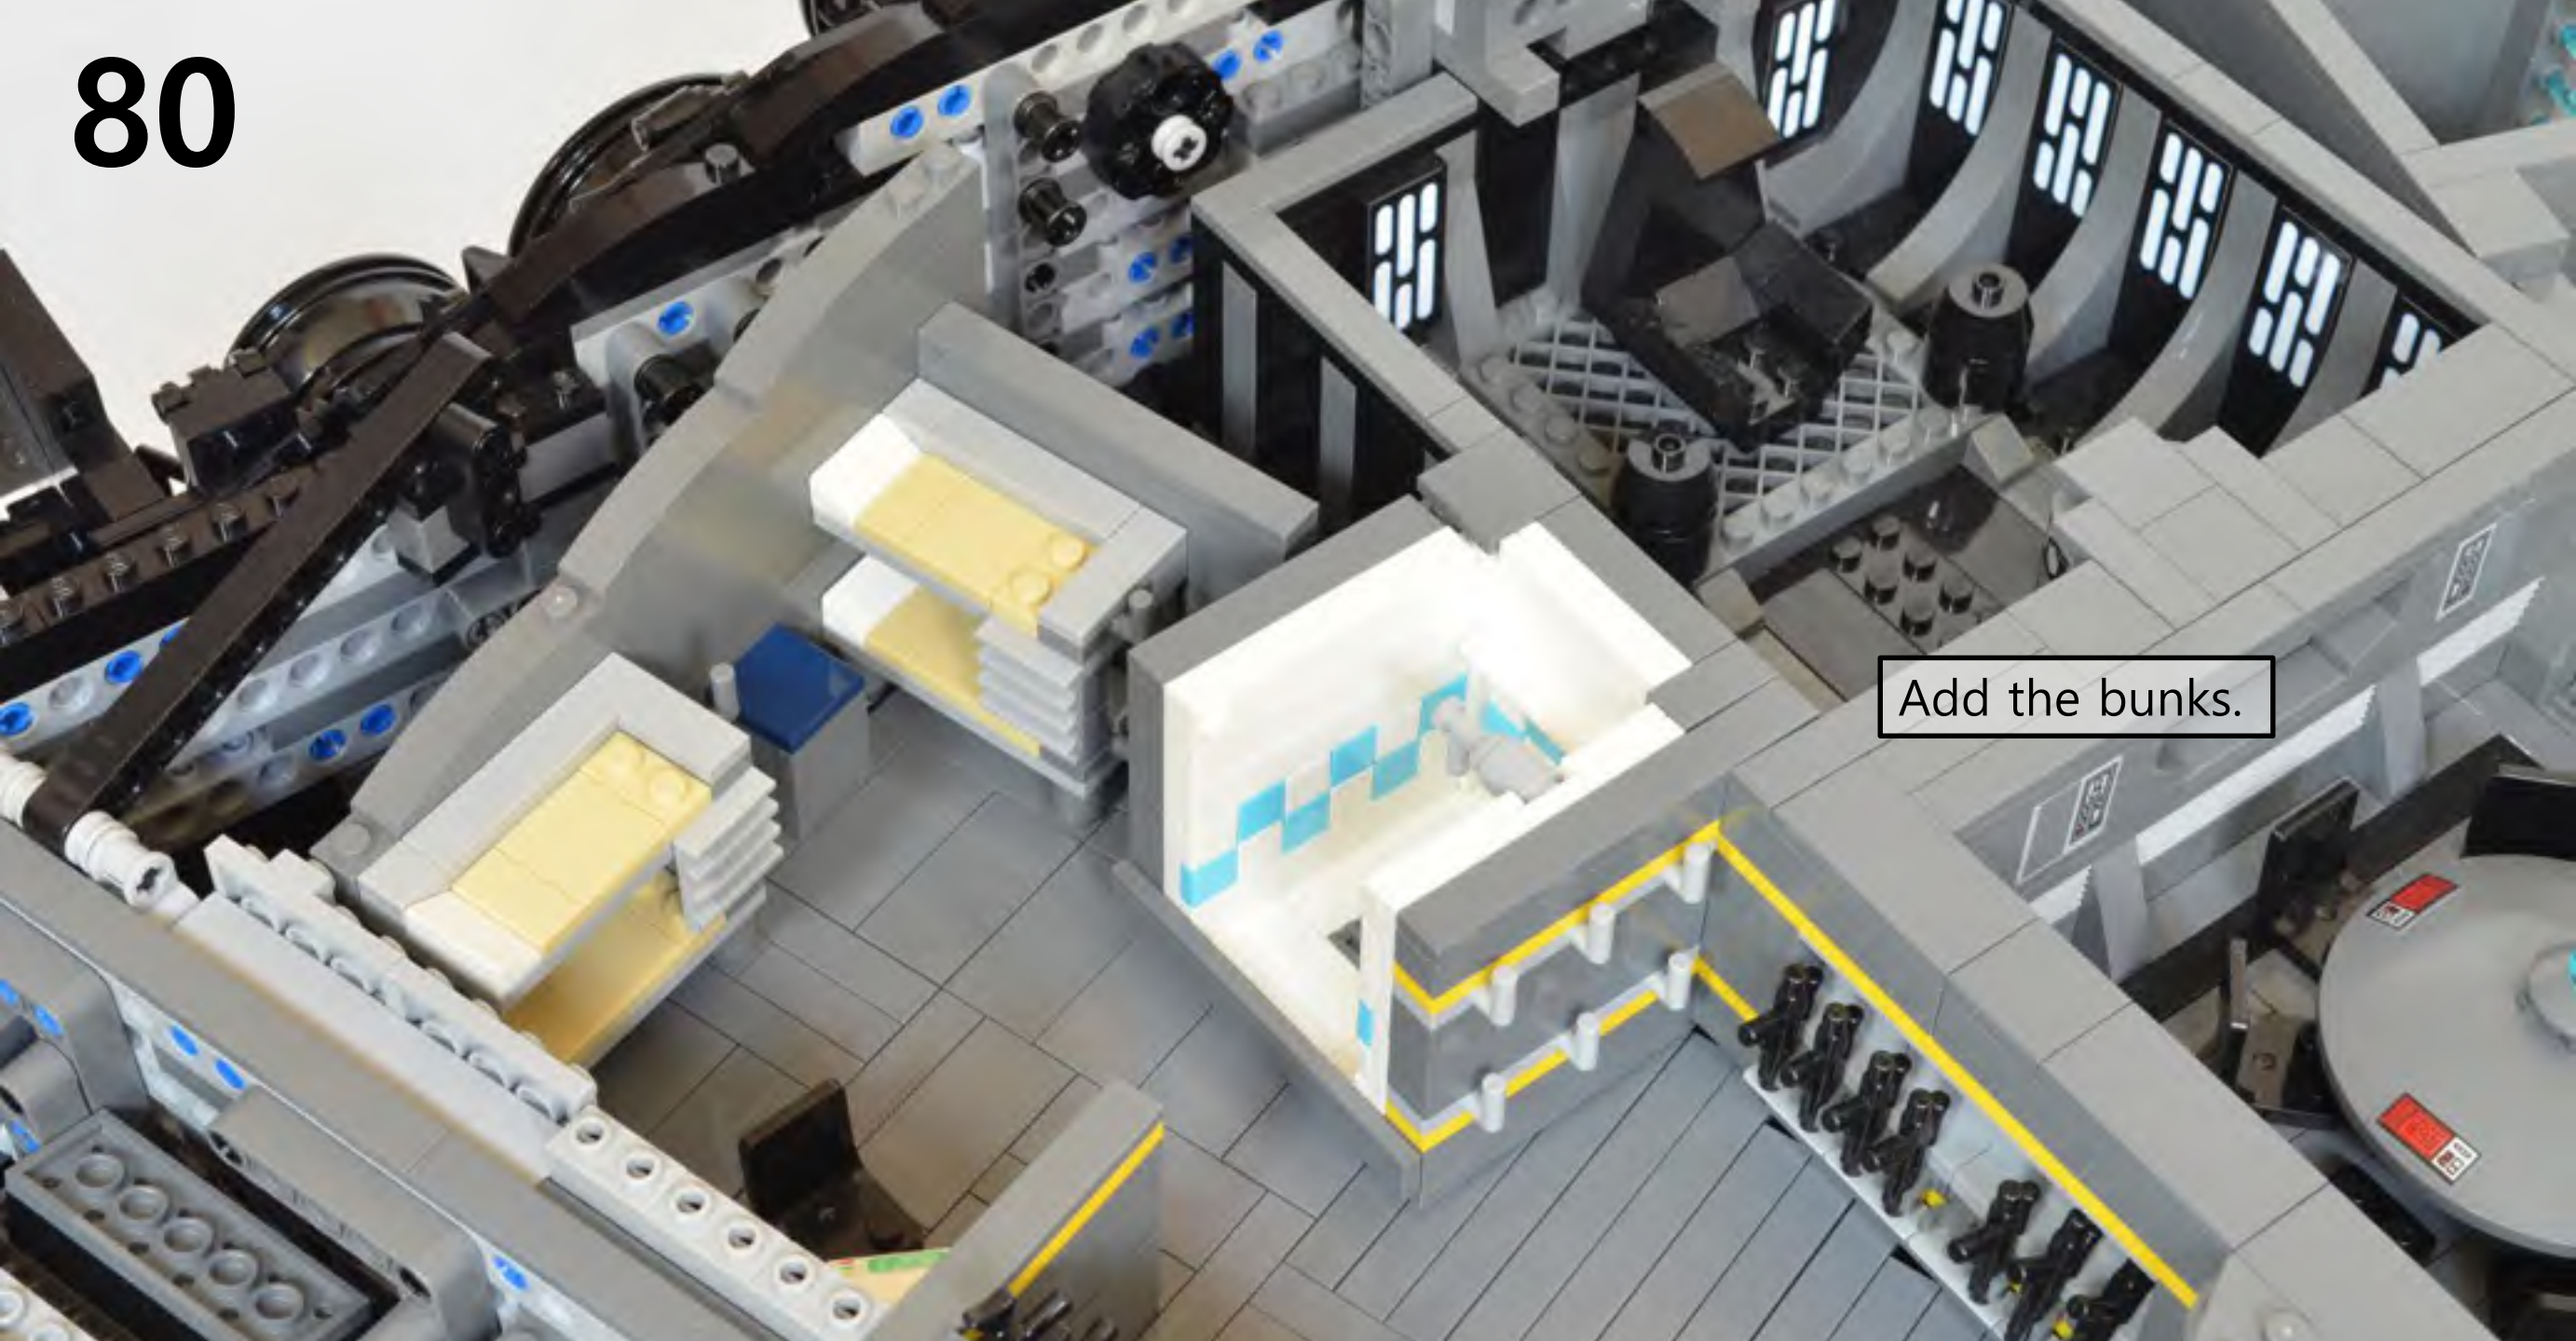




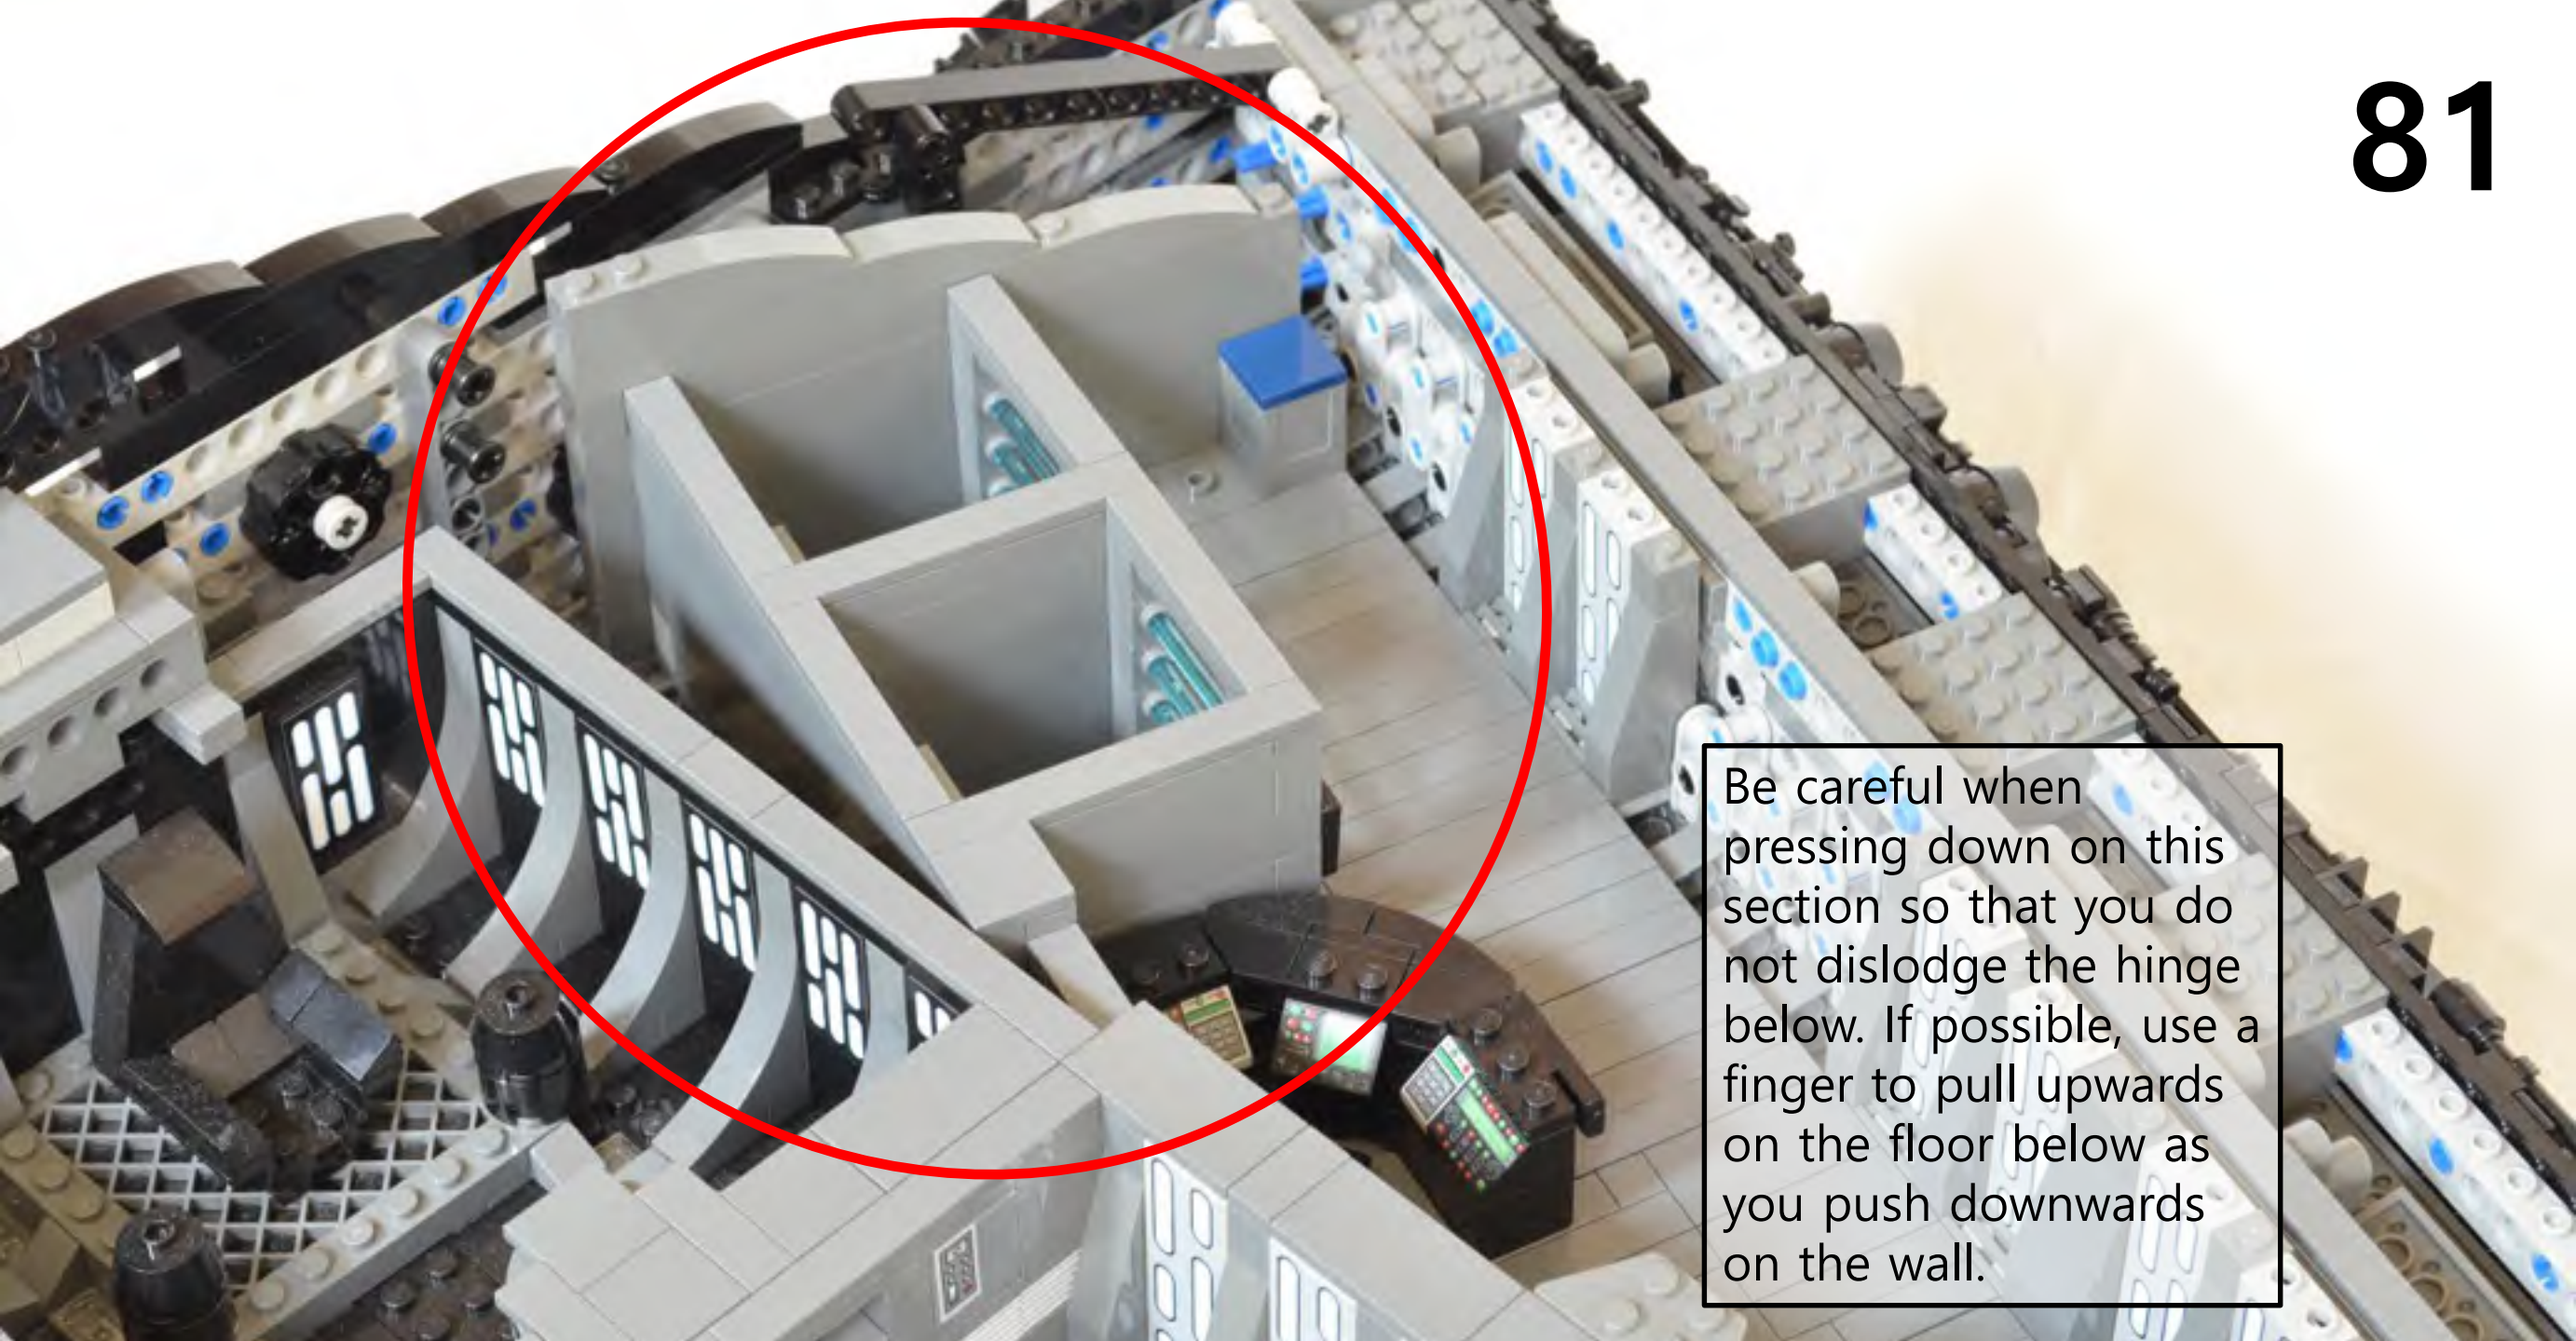
79

Be careful when pressing down on this section so that you do not dislodge the hinge below. If possible, use a finger to pull upwards on the floor below as you push downwards on the wall.

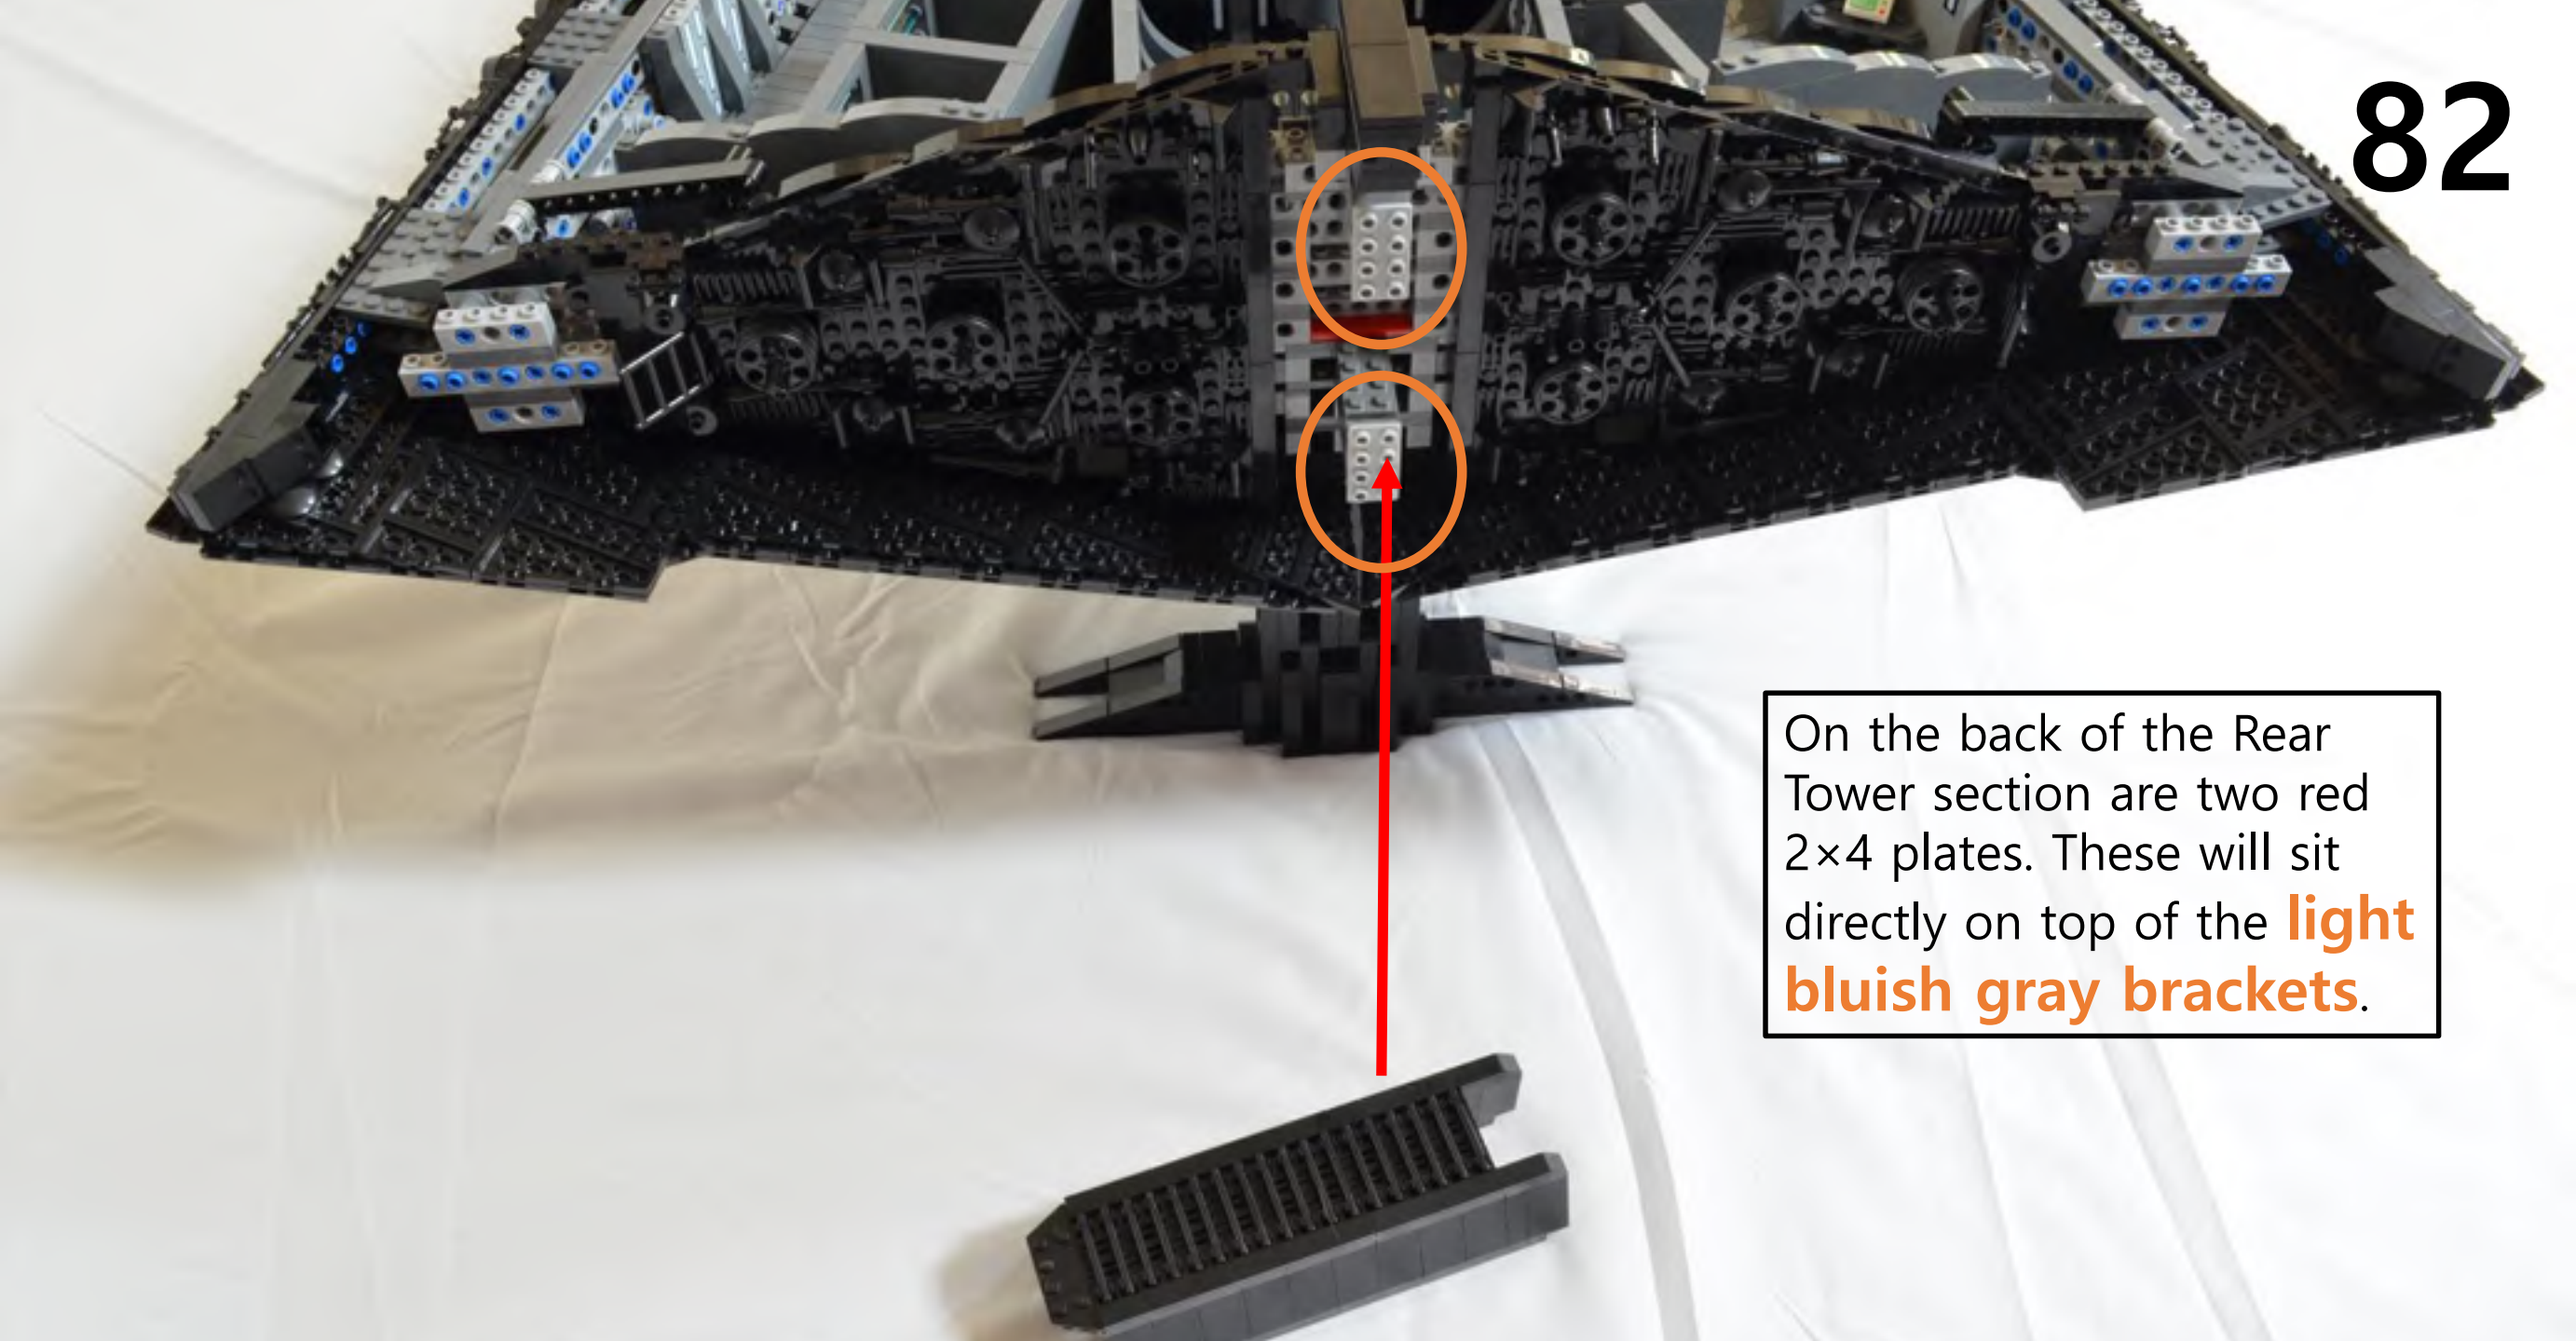




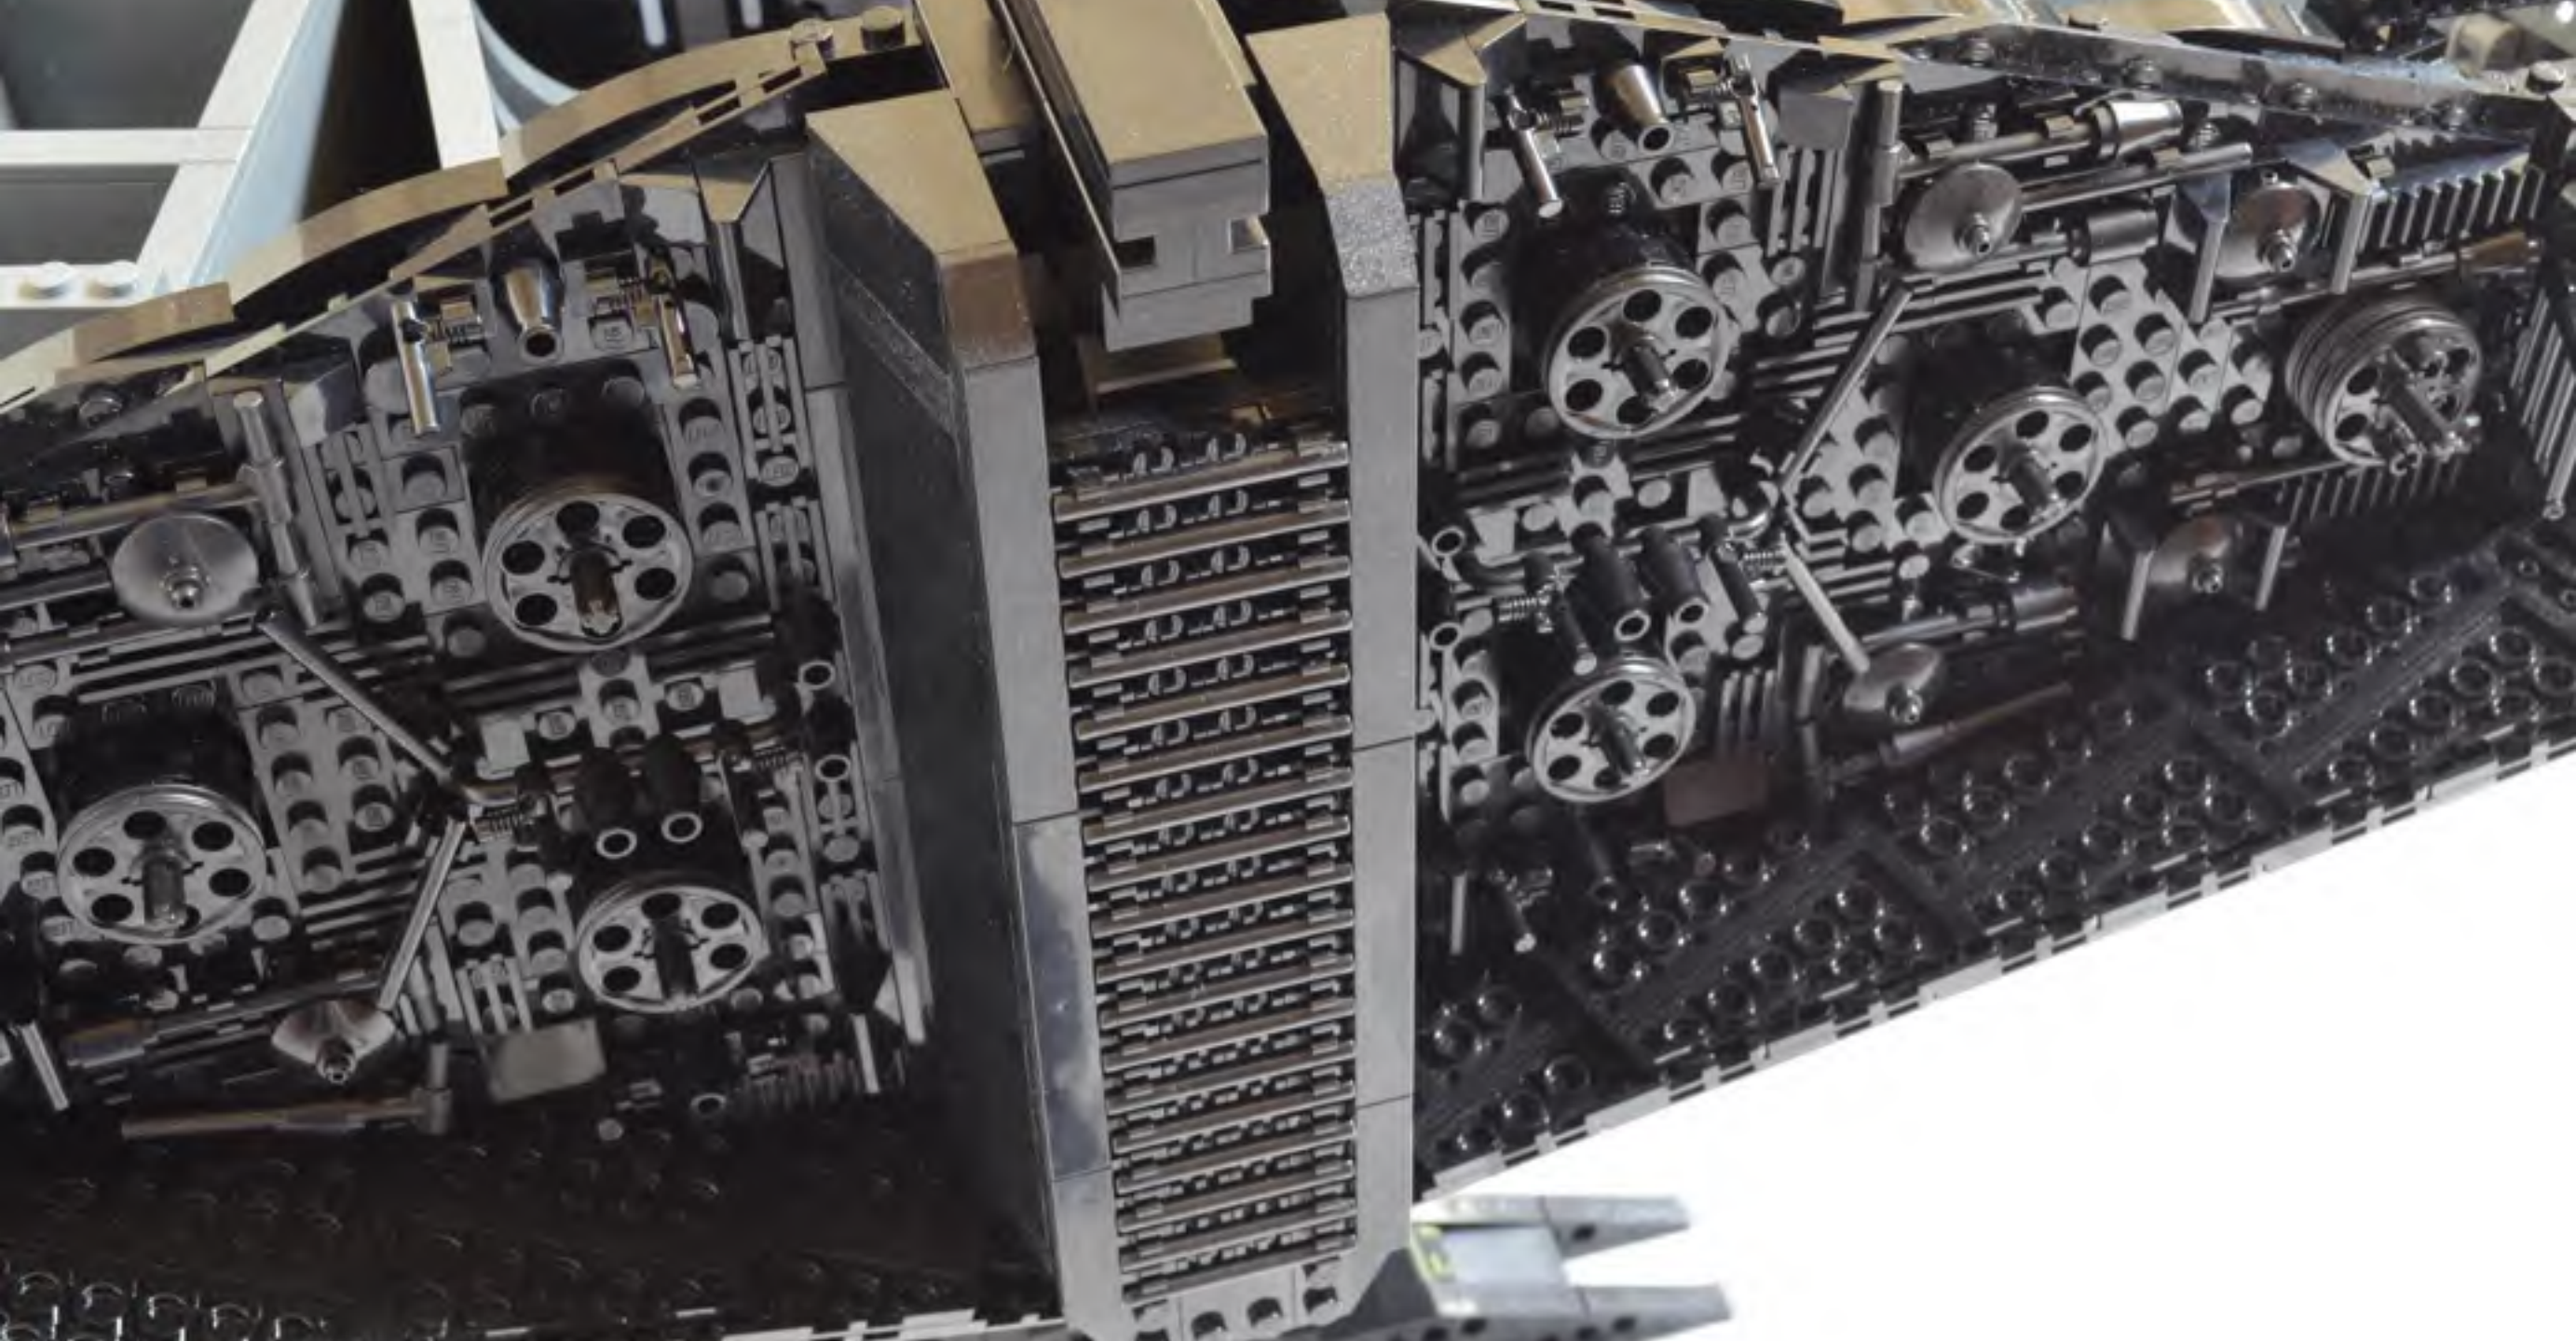
Add the bunks.



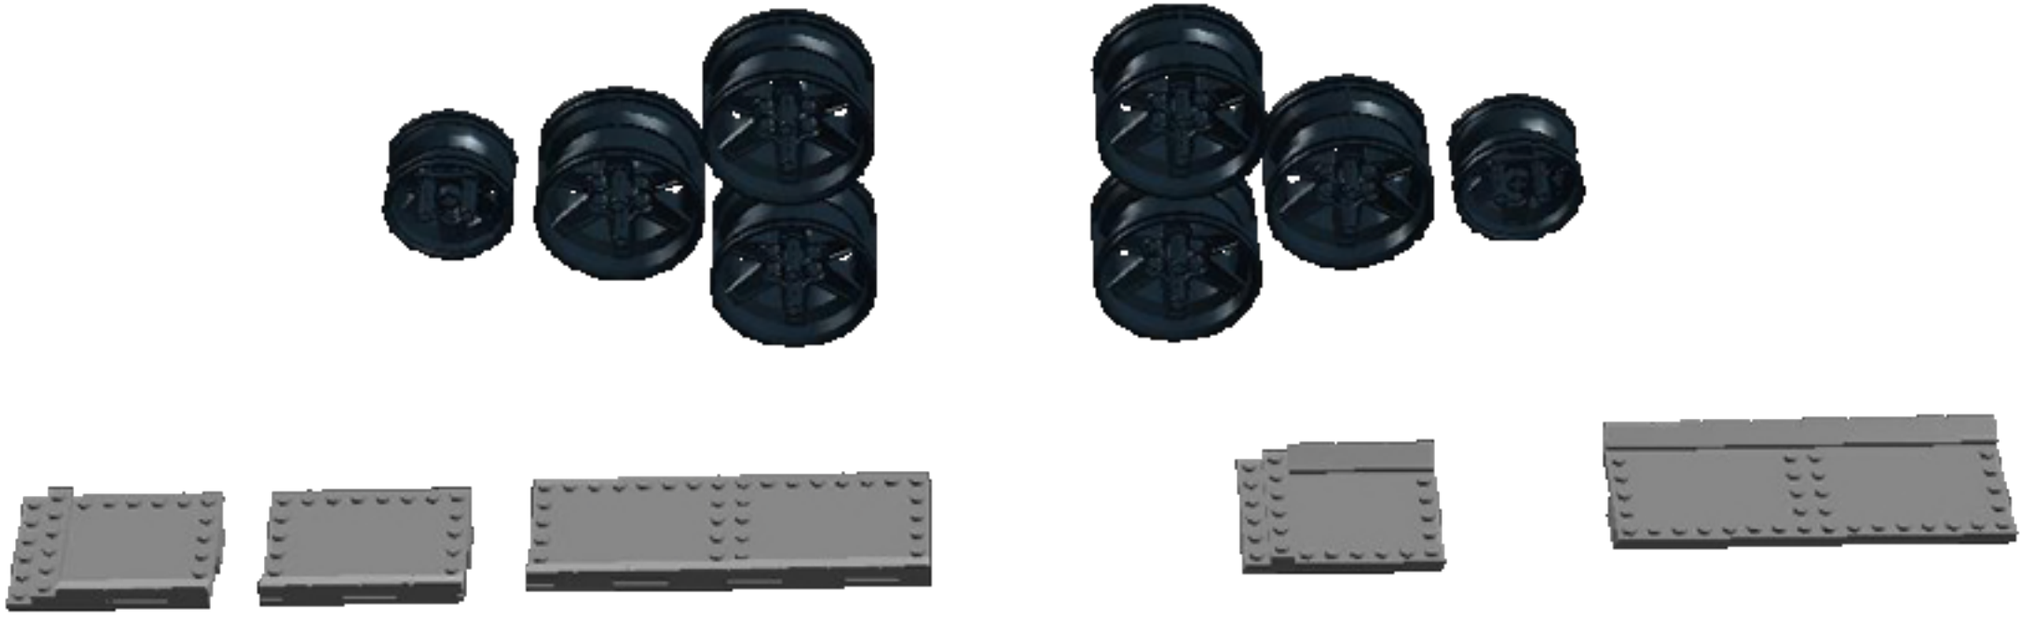
Be careful when pressing down on this section so that you do not dislodge the hinge below. If possible, use a finger to pull upwards on the floor below as you push downwards on the wall.

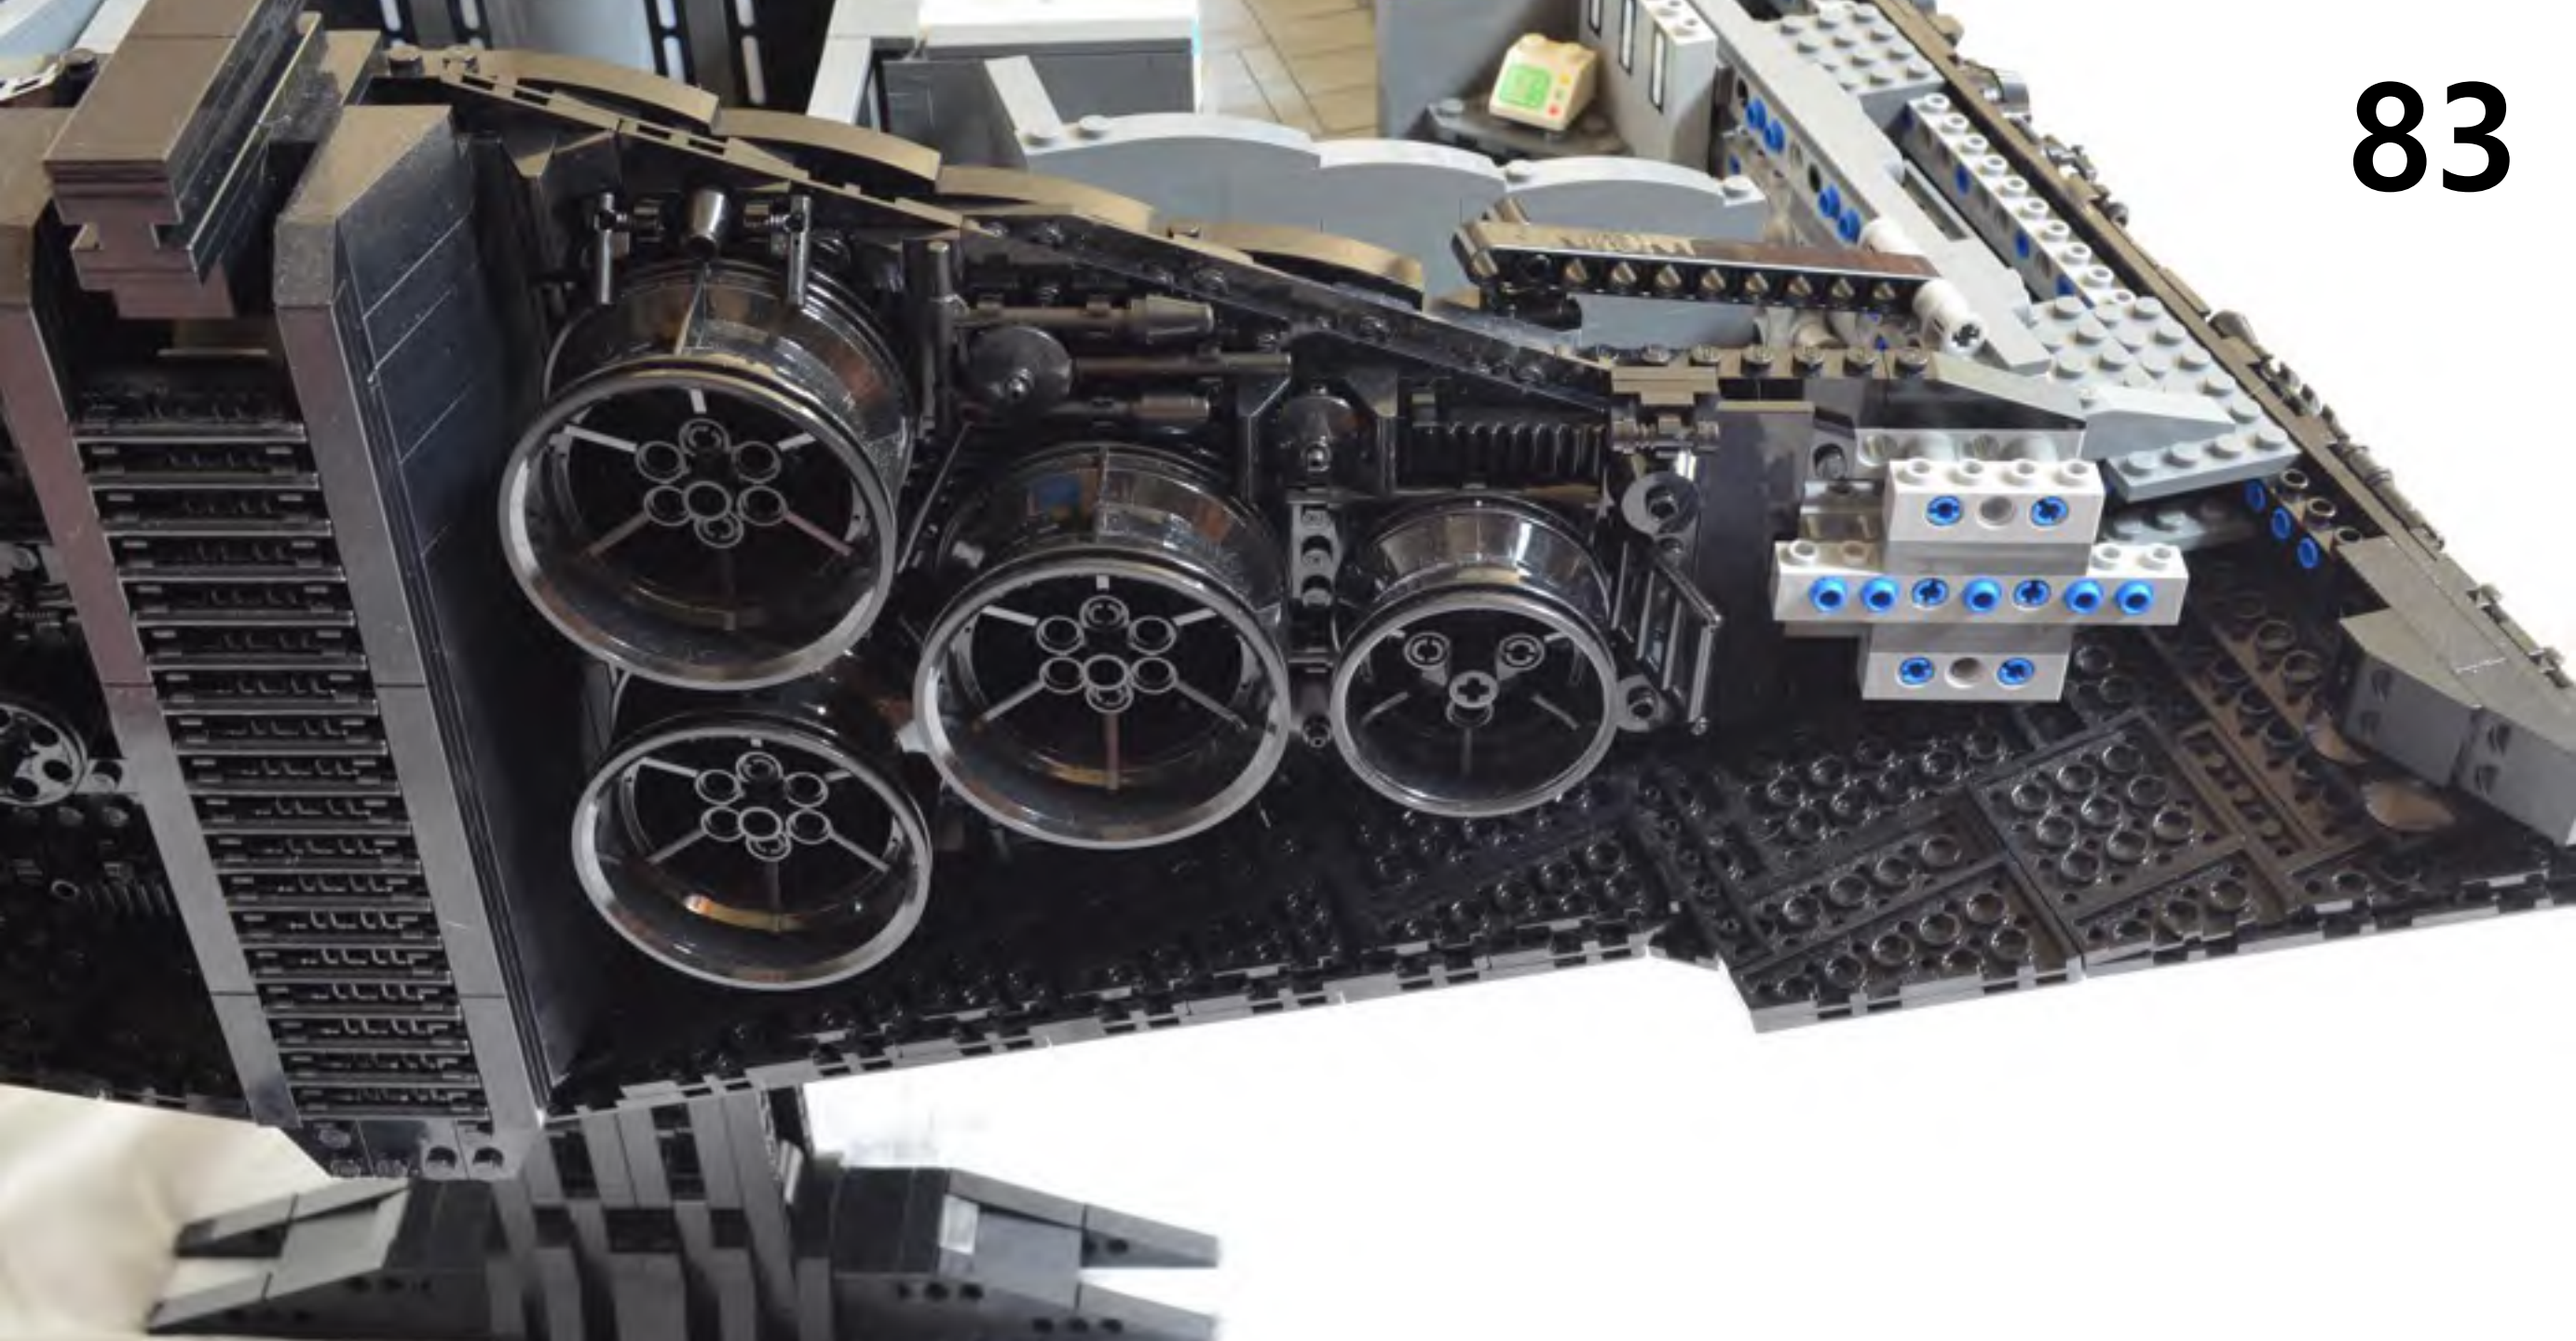


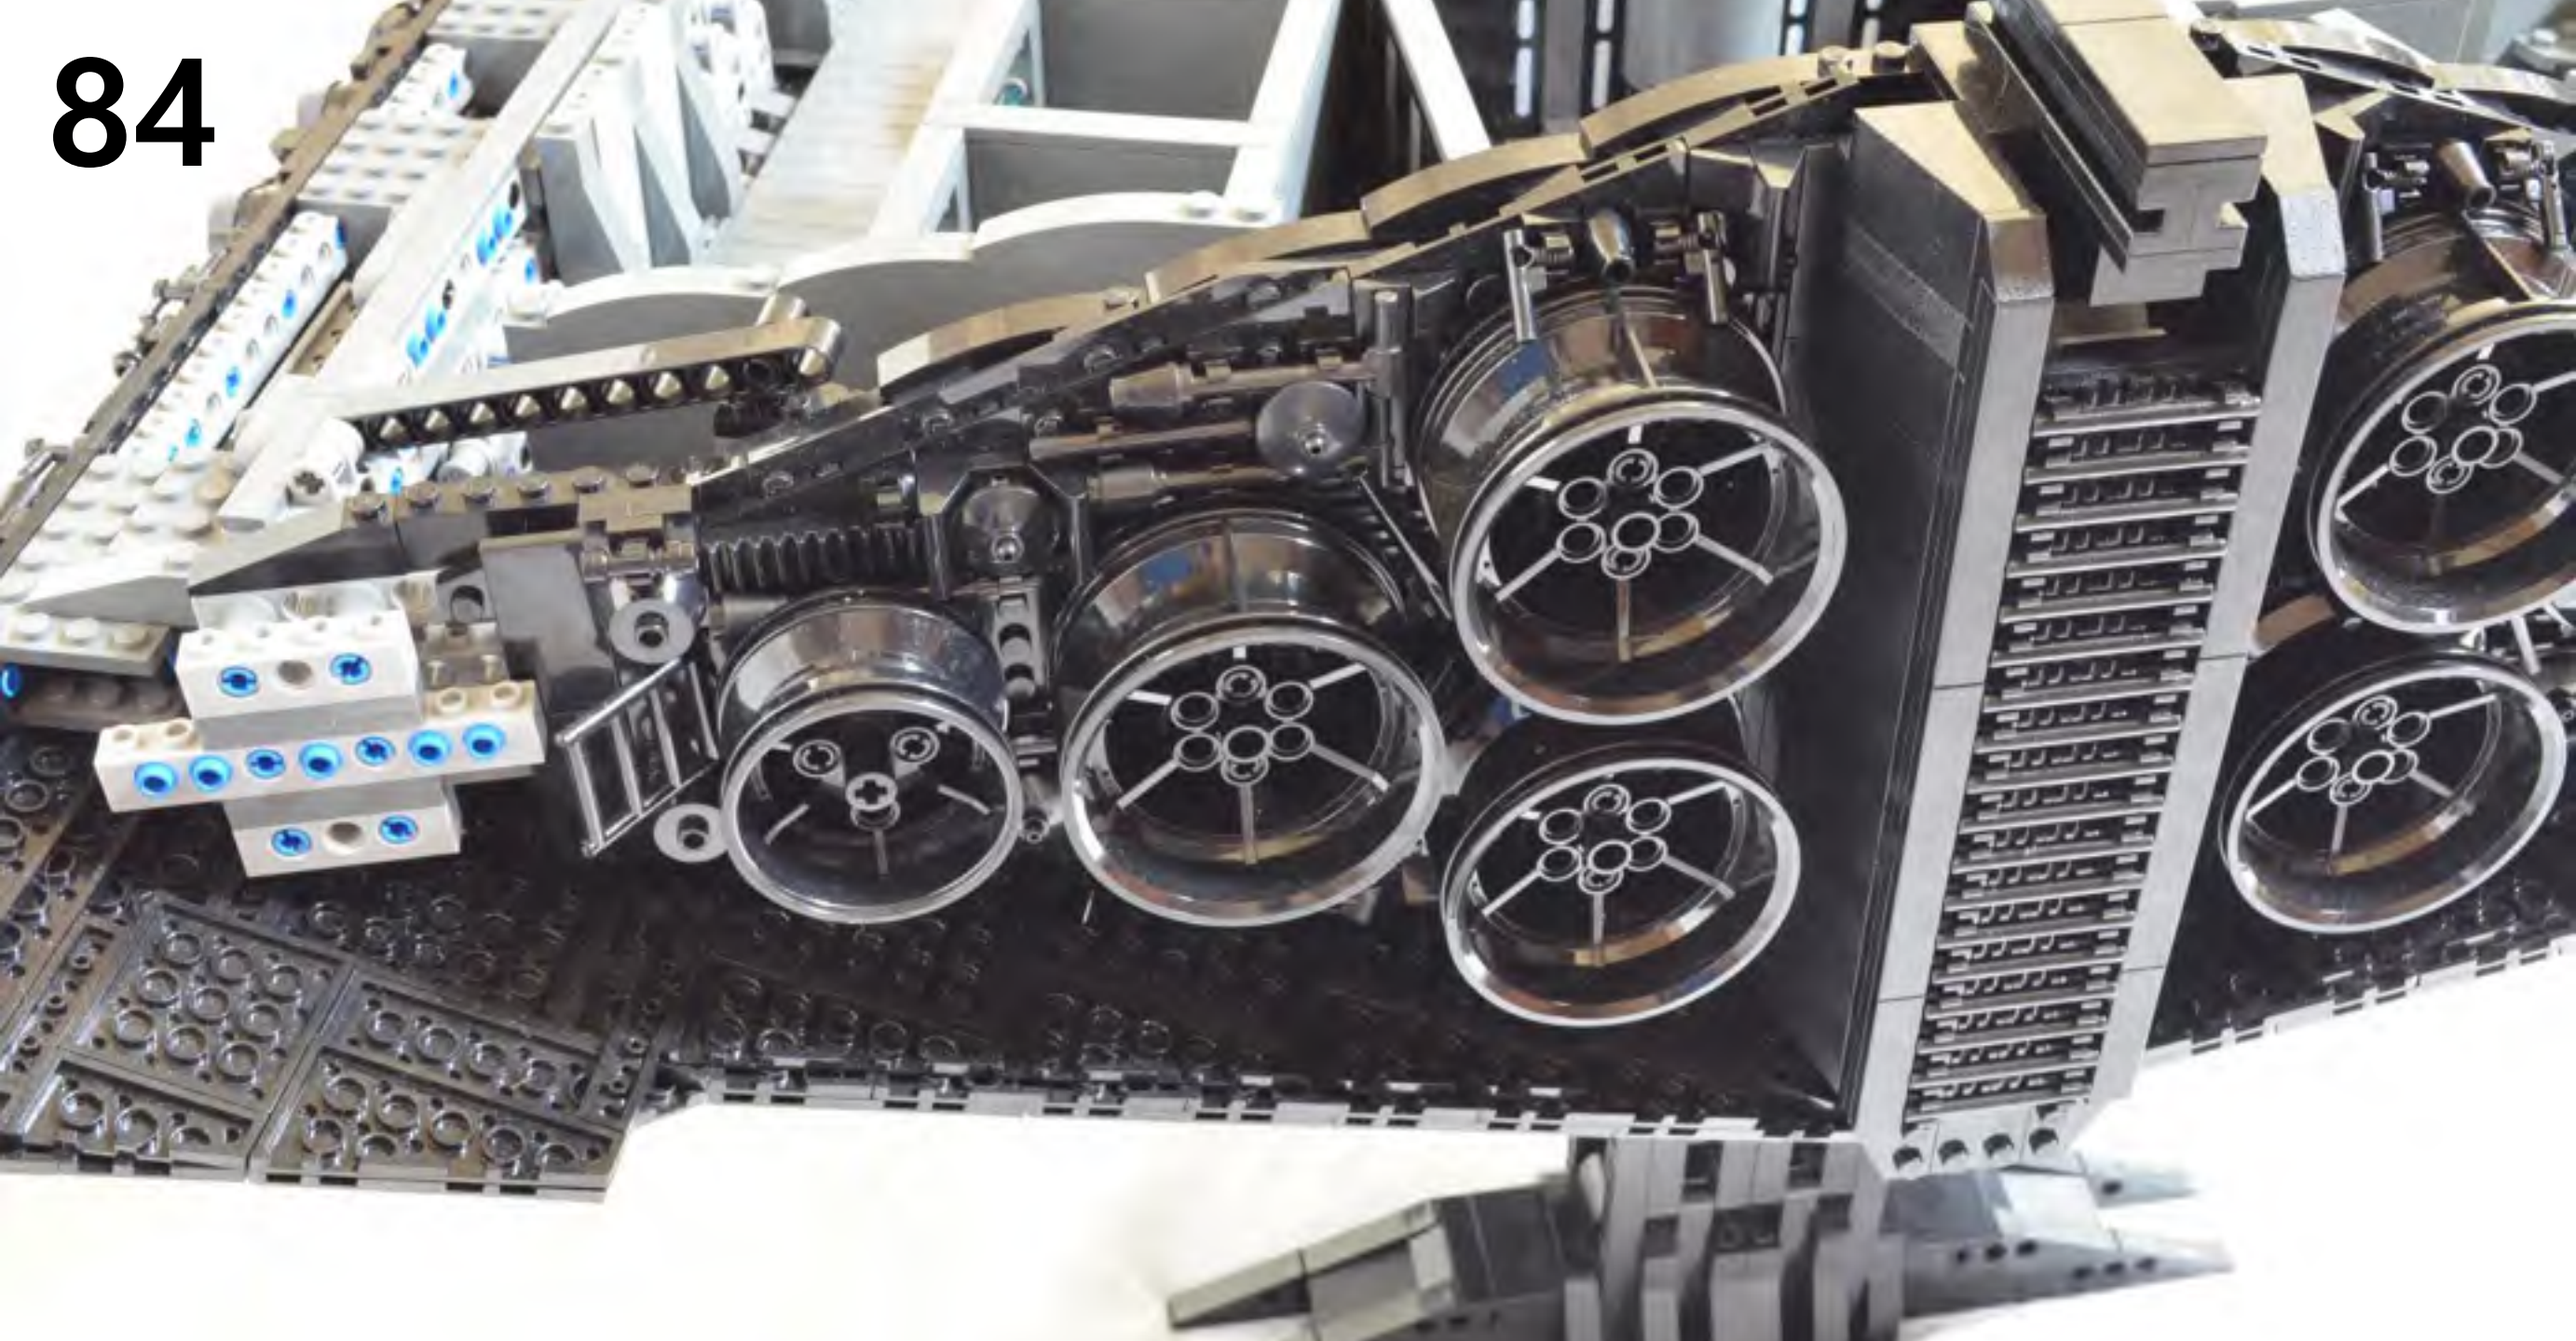
On the back of the Rear Tower section are two red 2×4 plates. These will sit directly on top of the **light bluish gray brackets**.

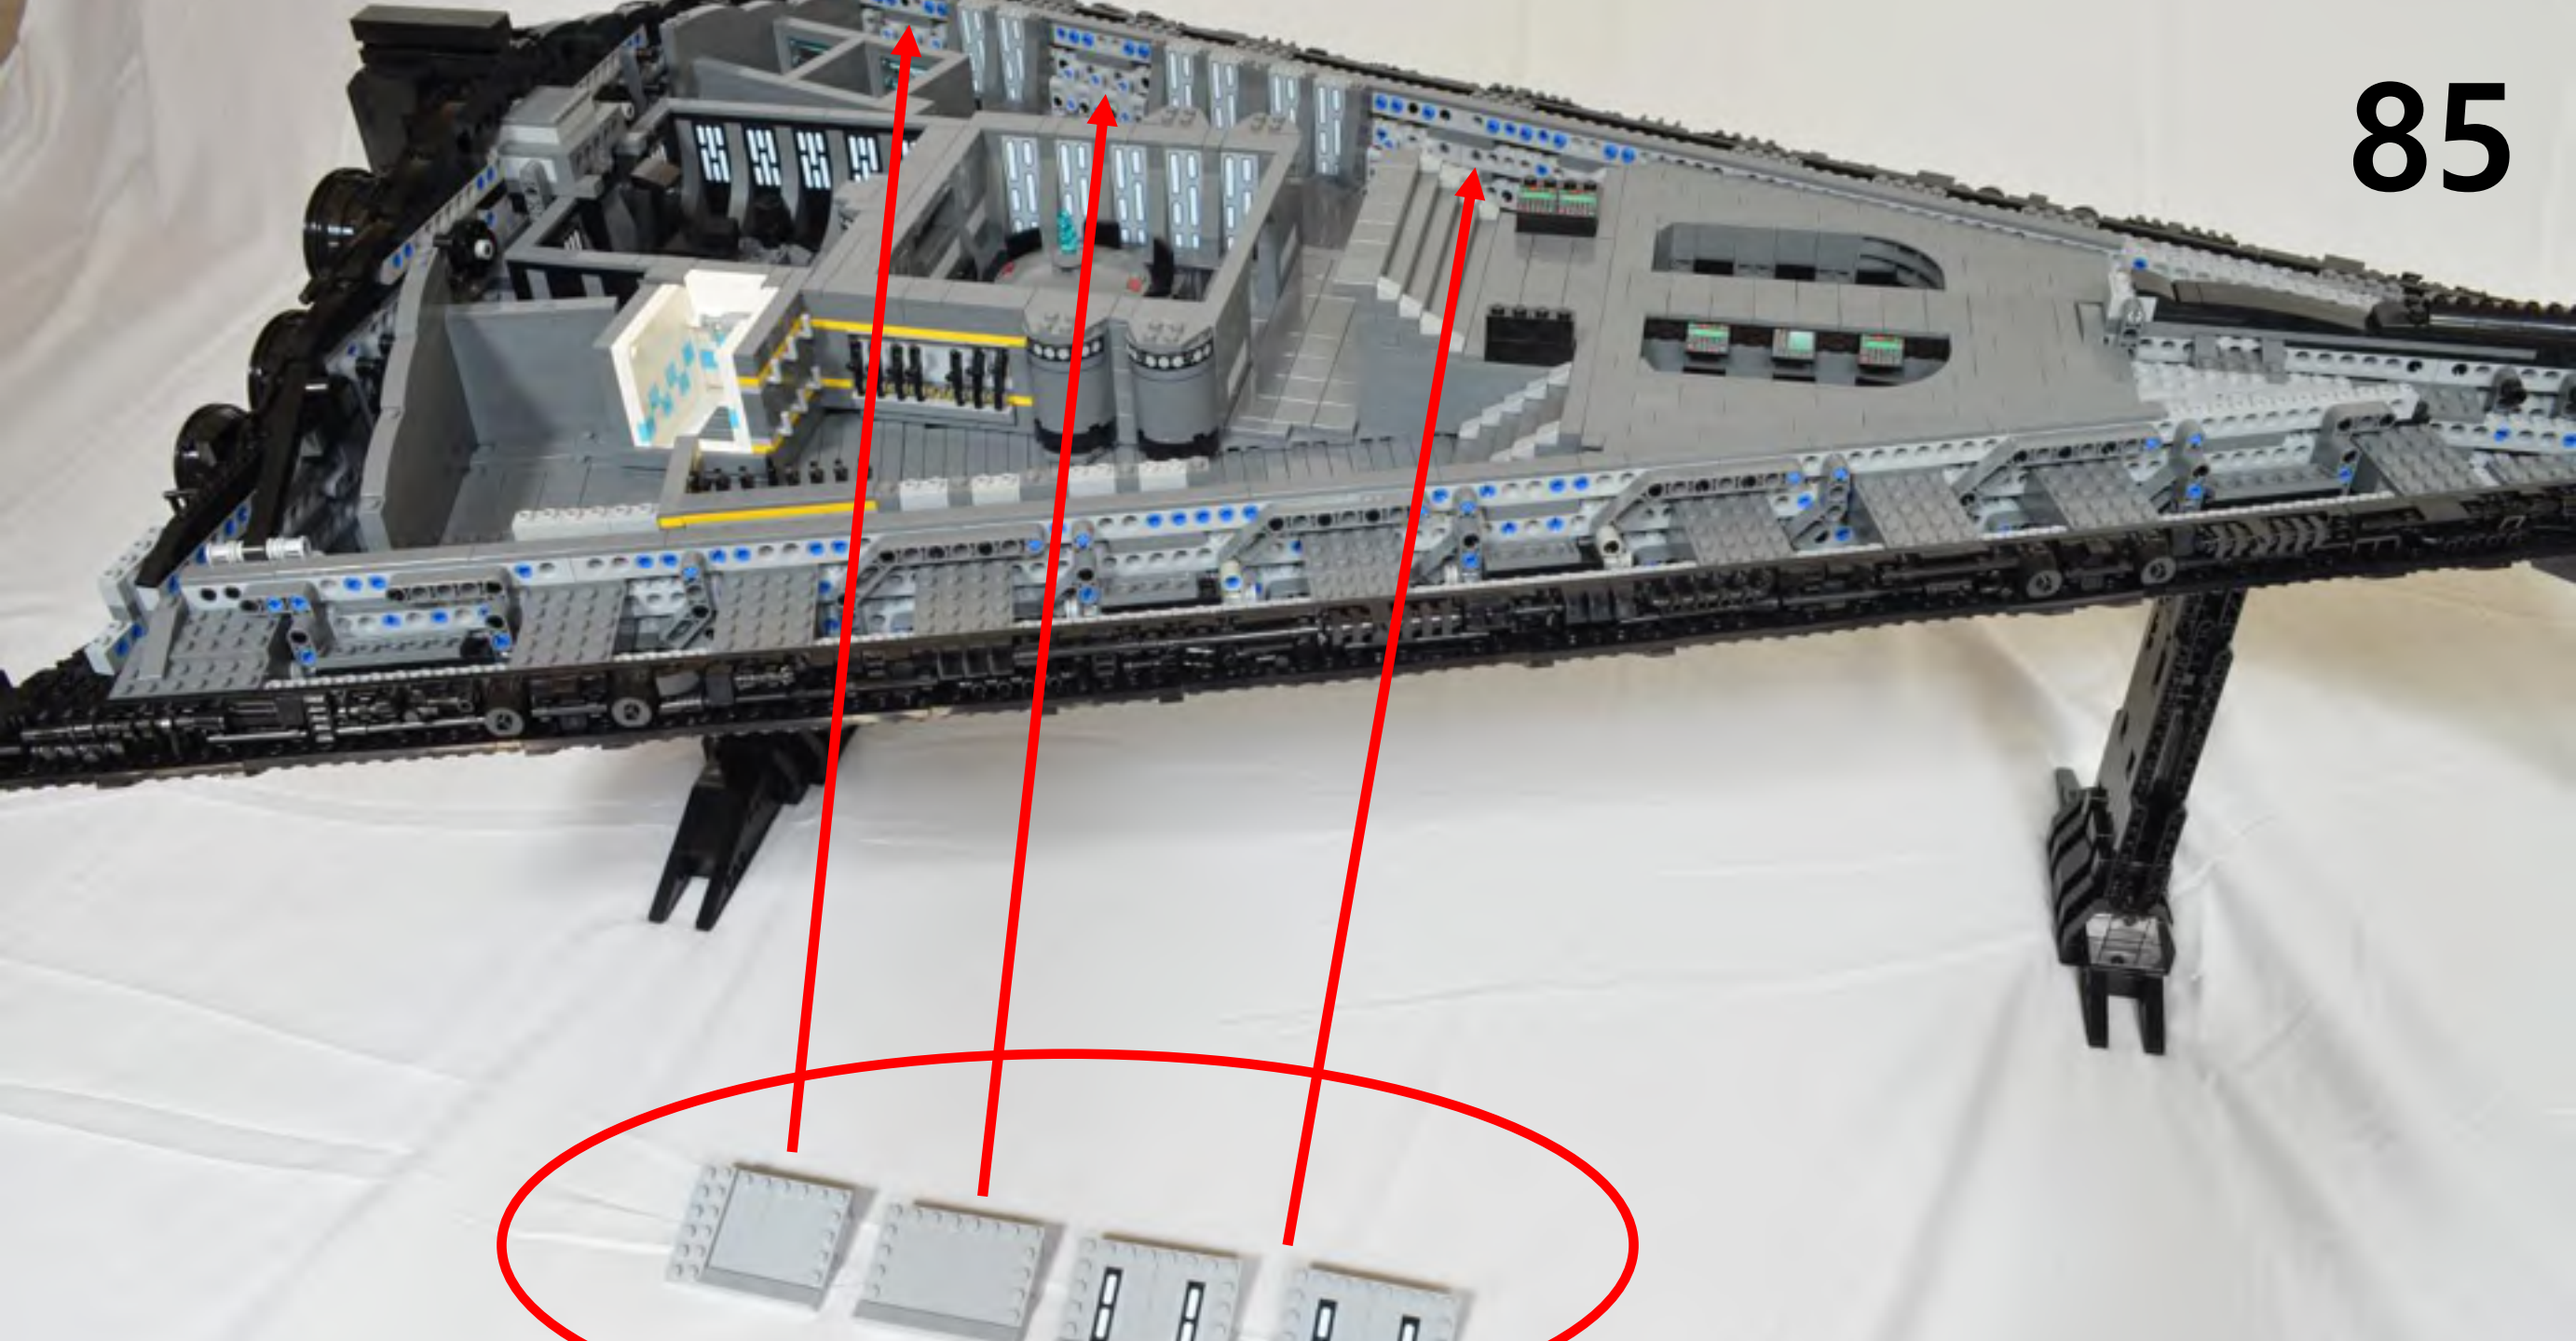


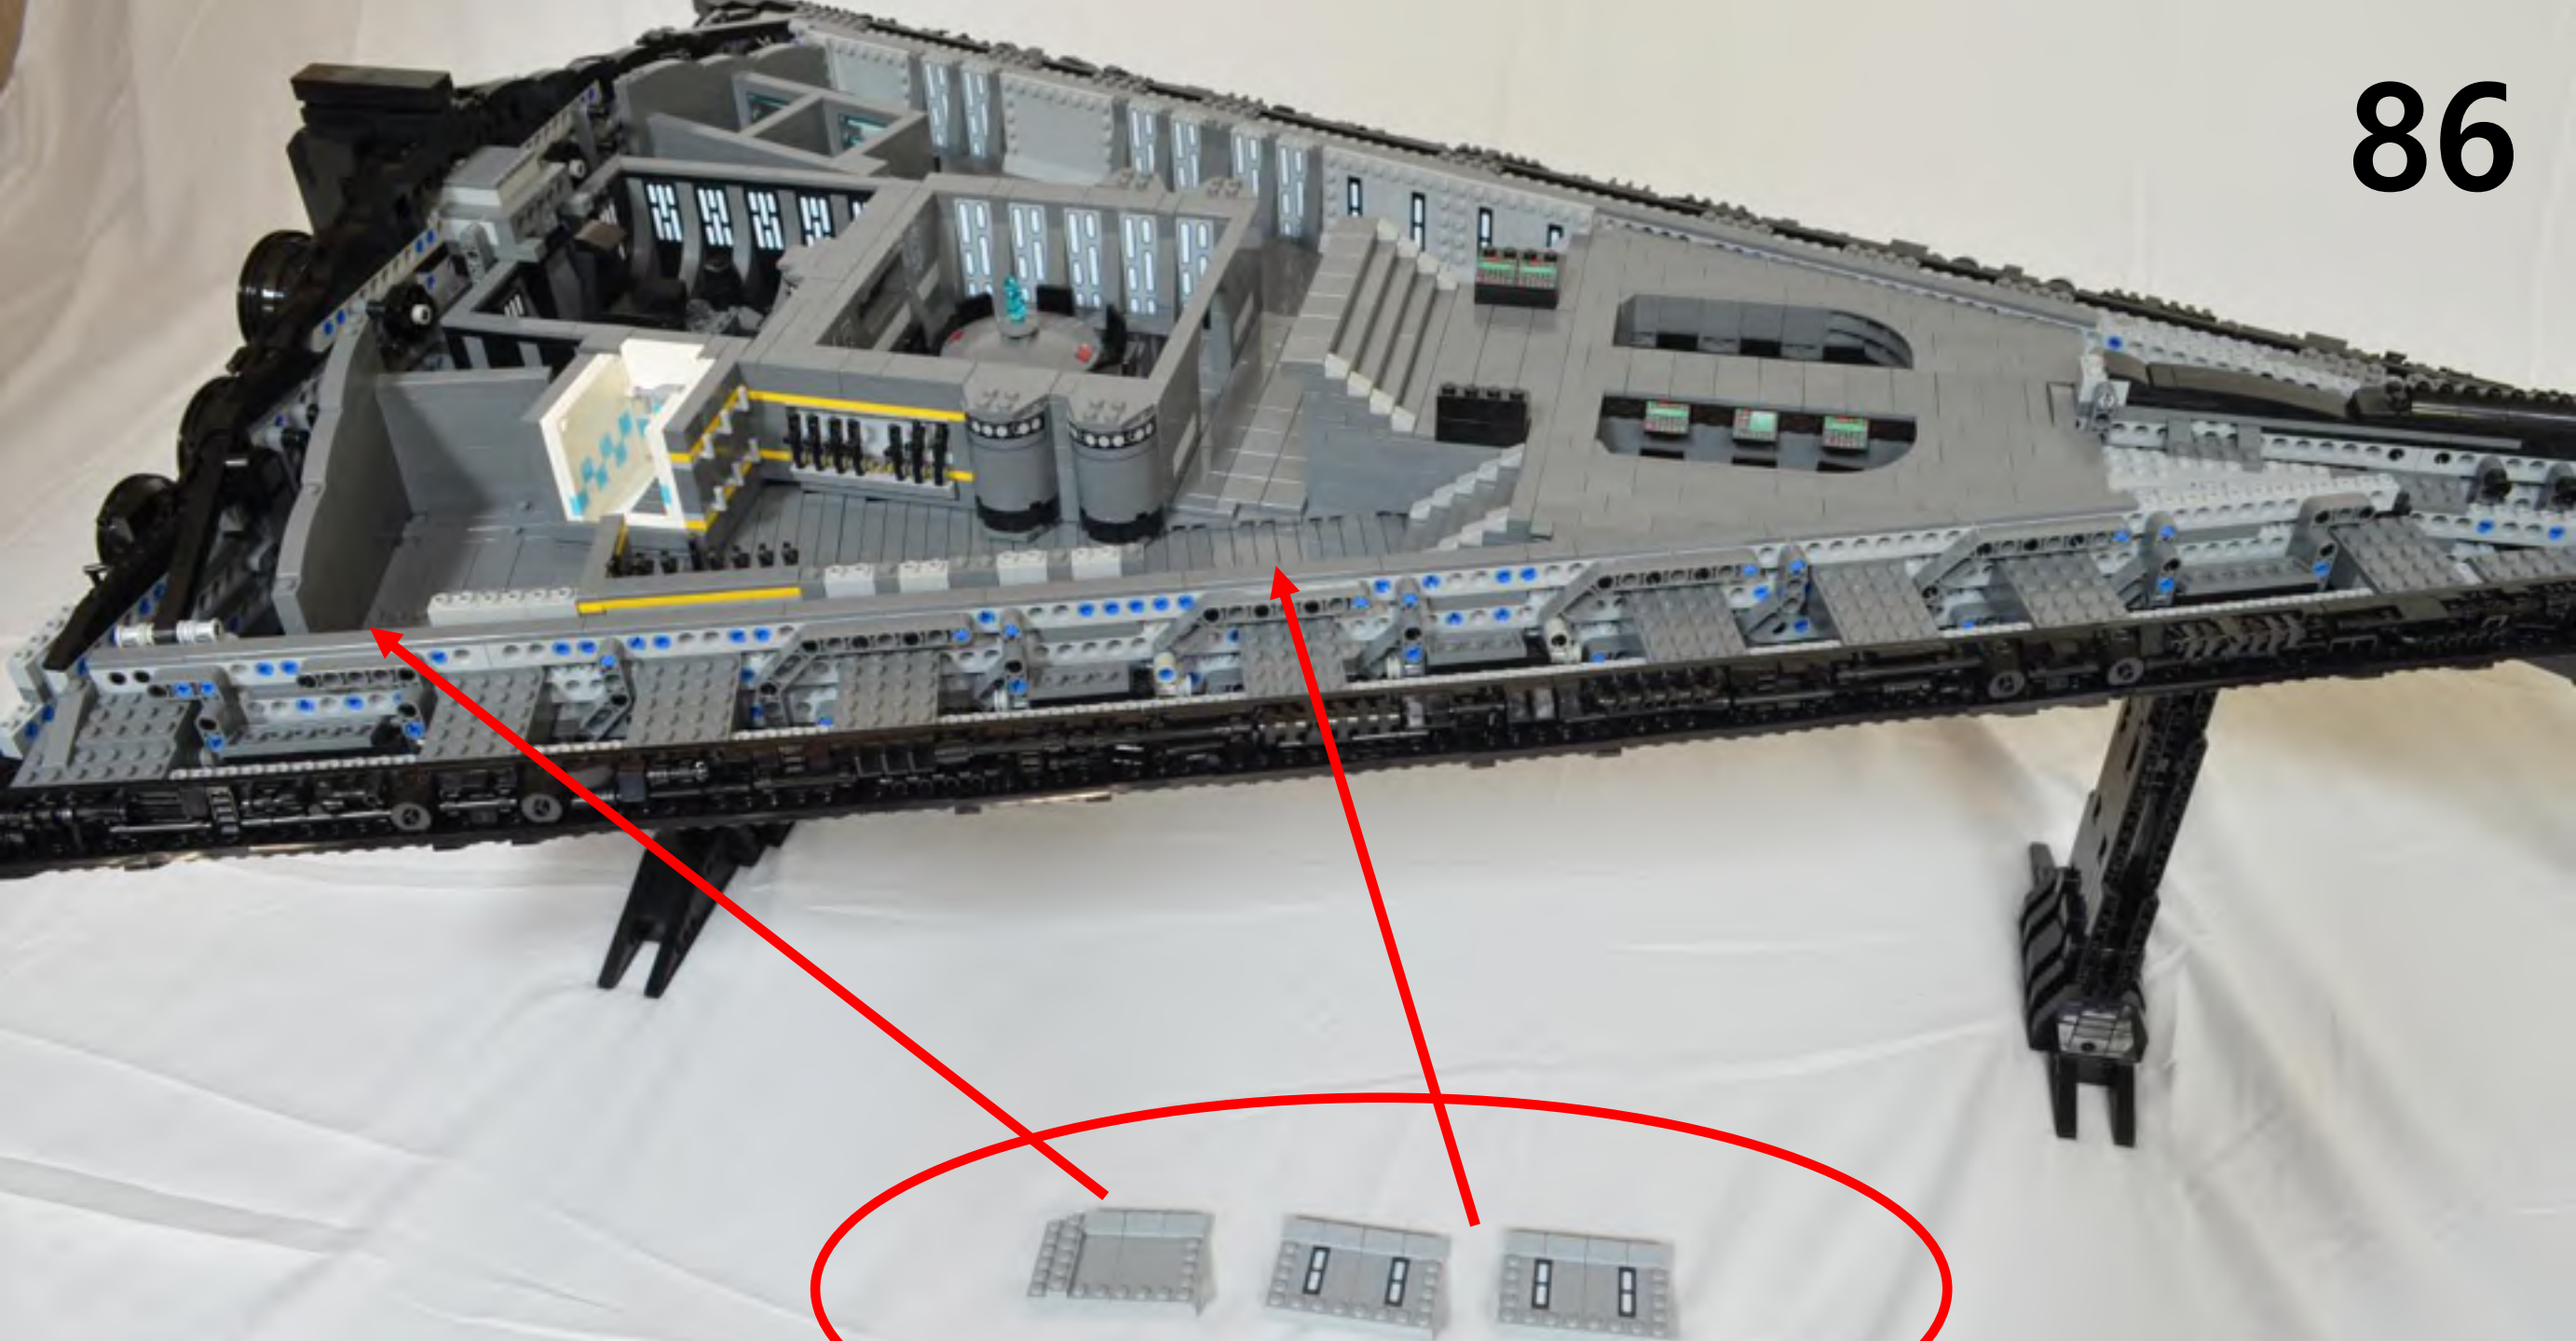
Assemble Section 19: Engines



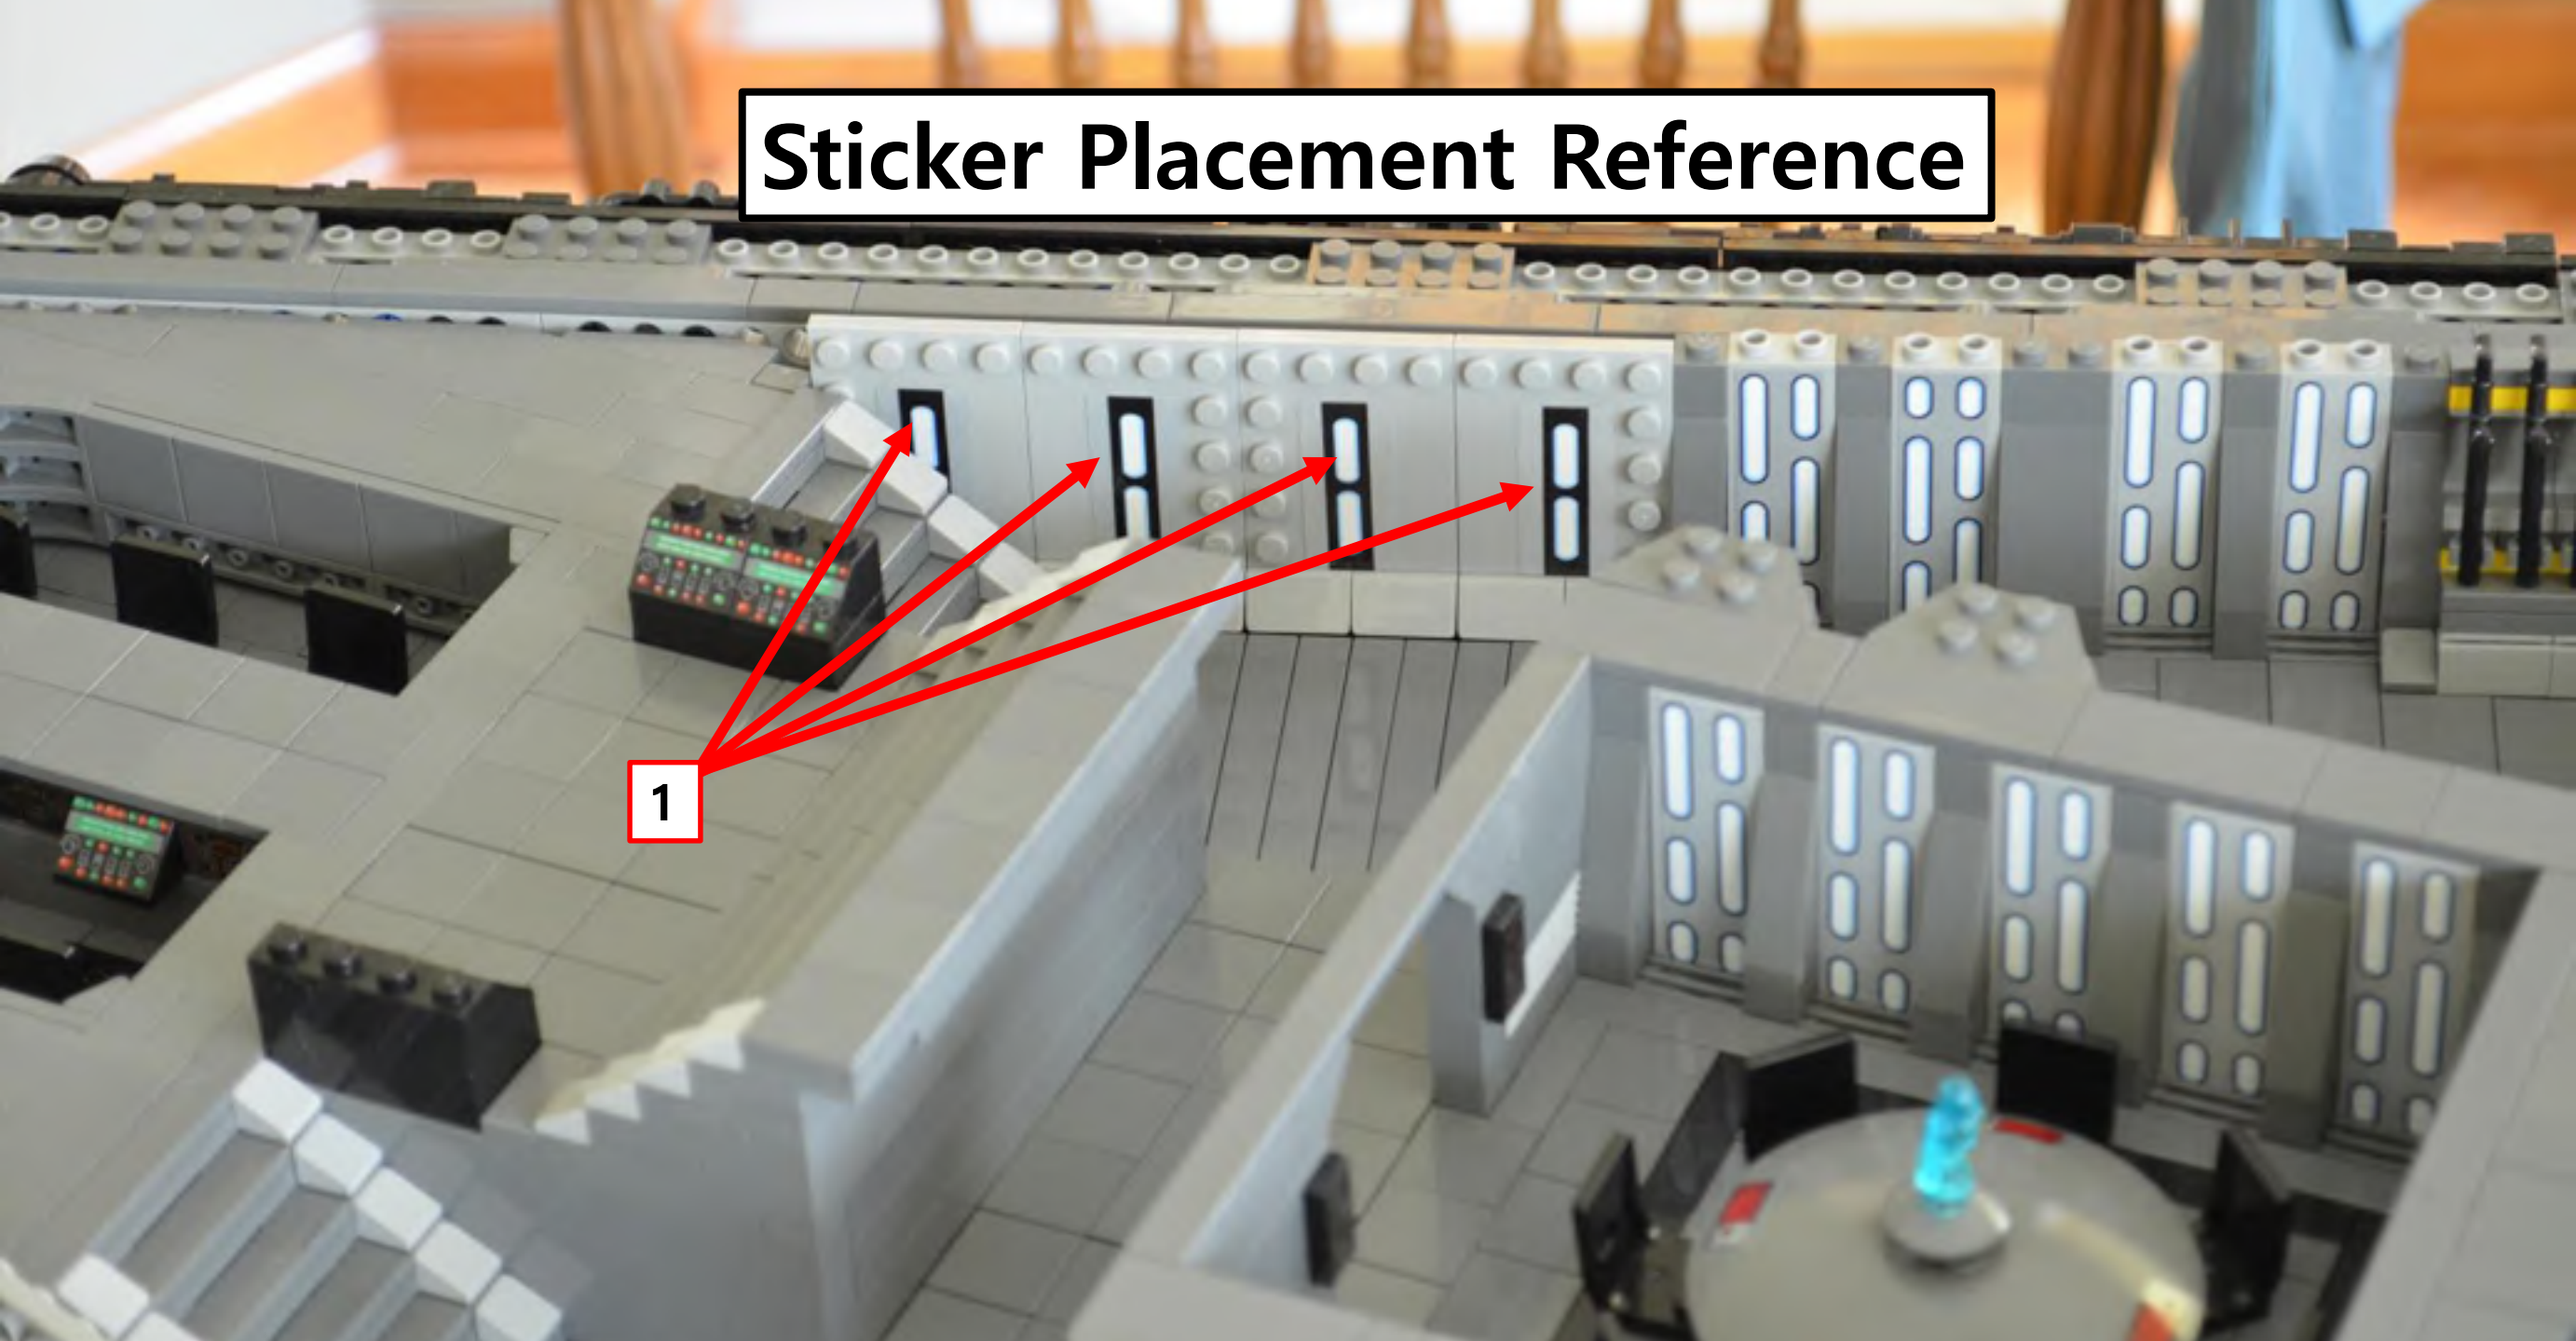


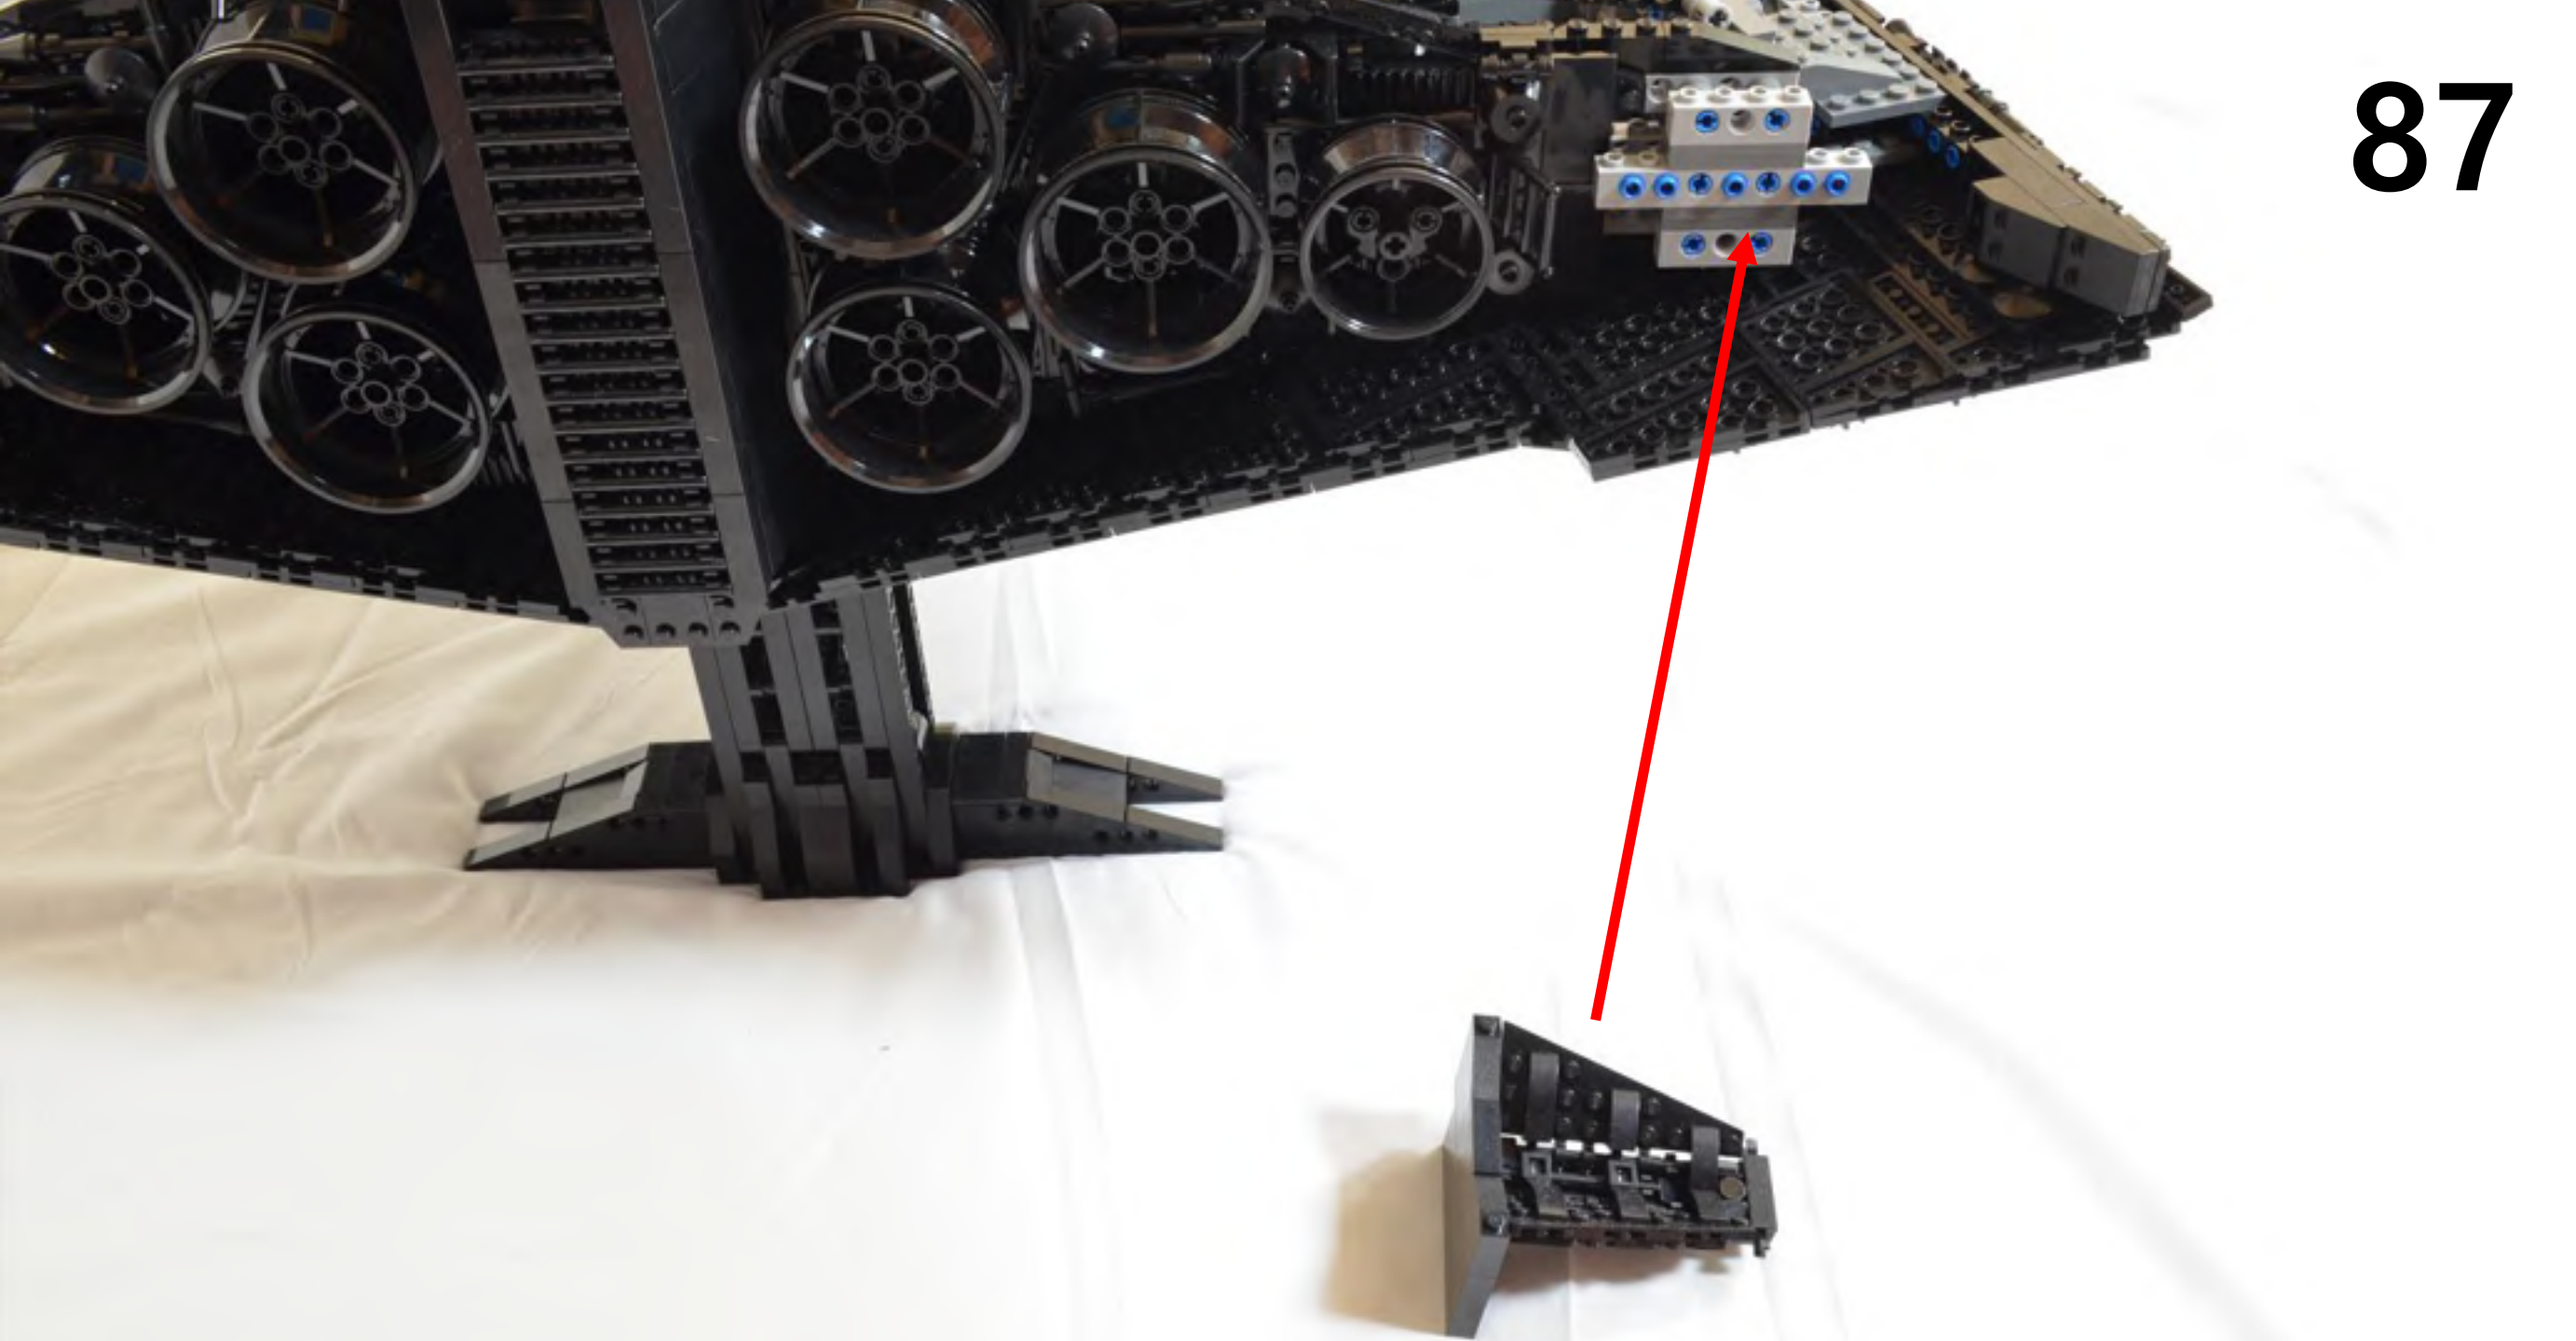


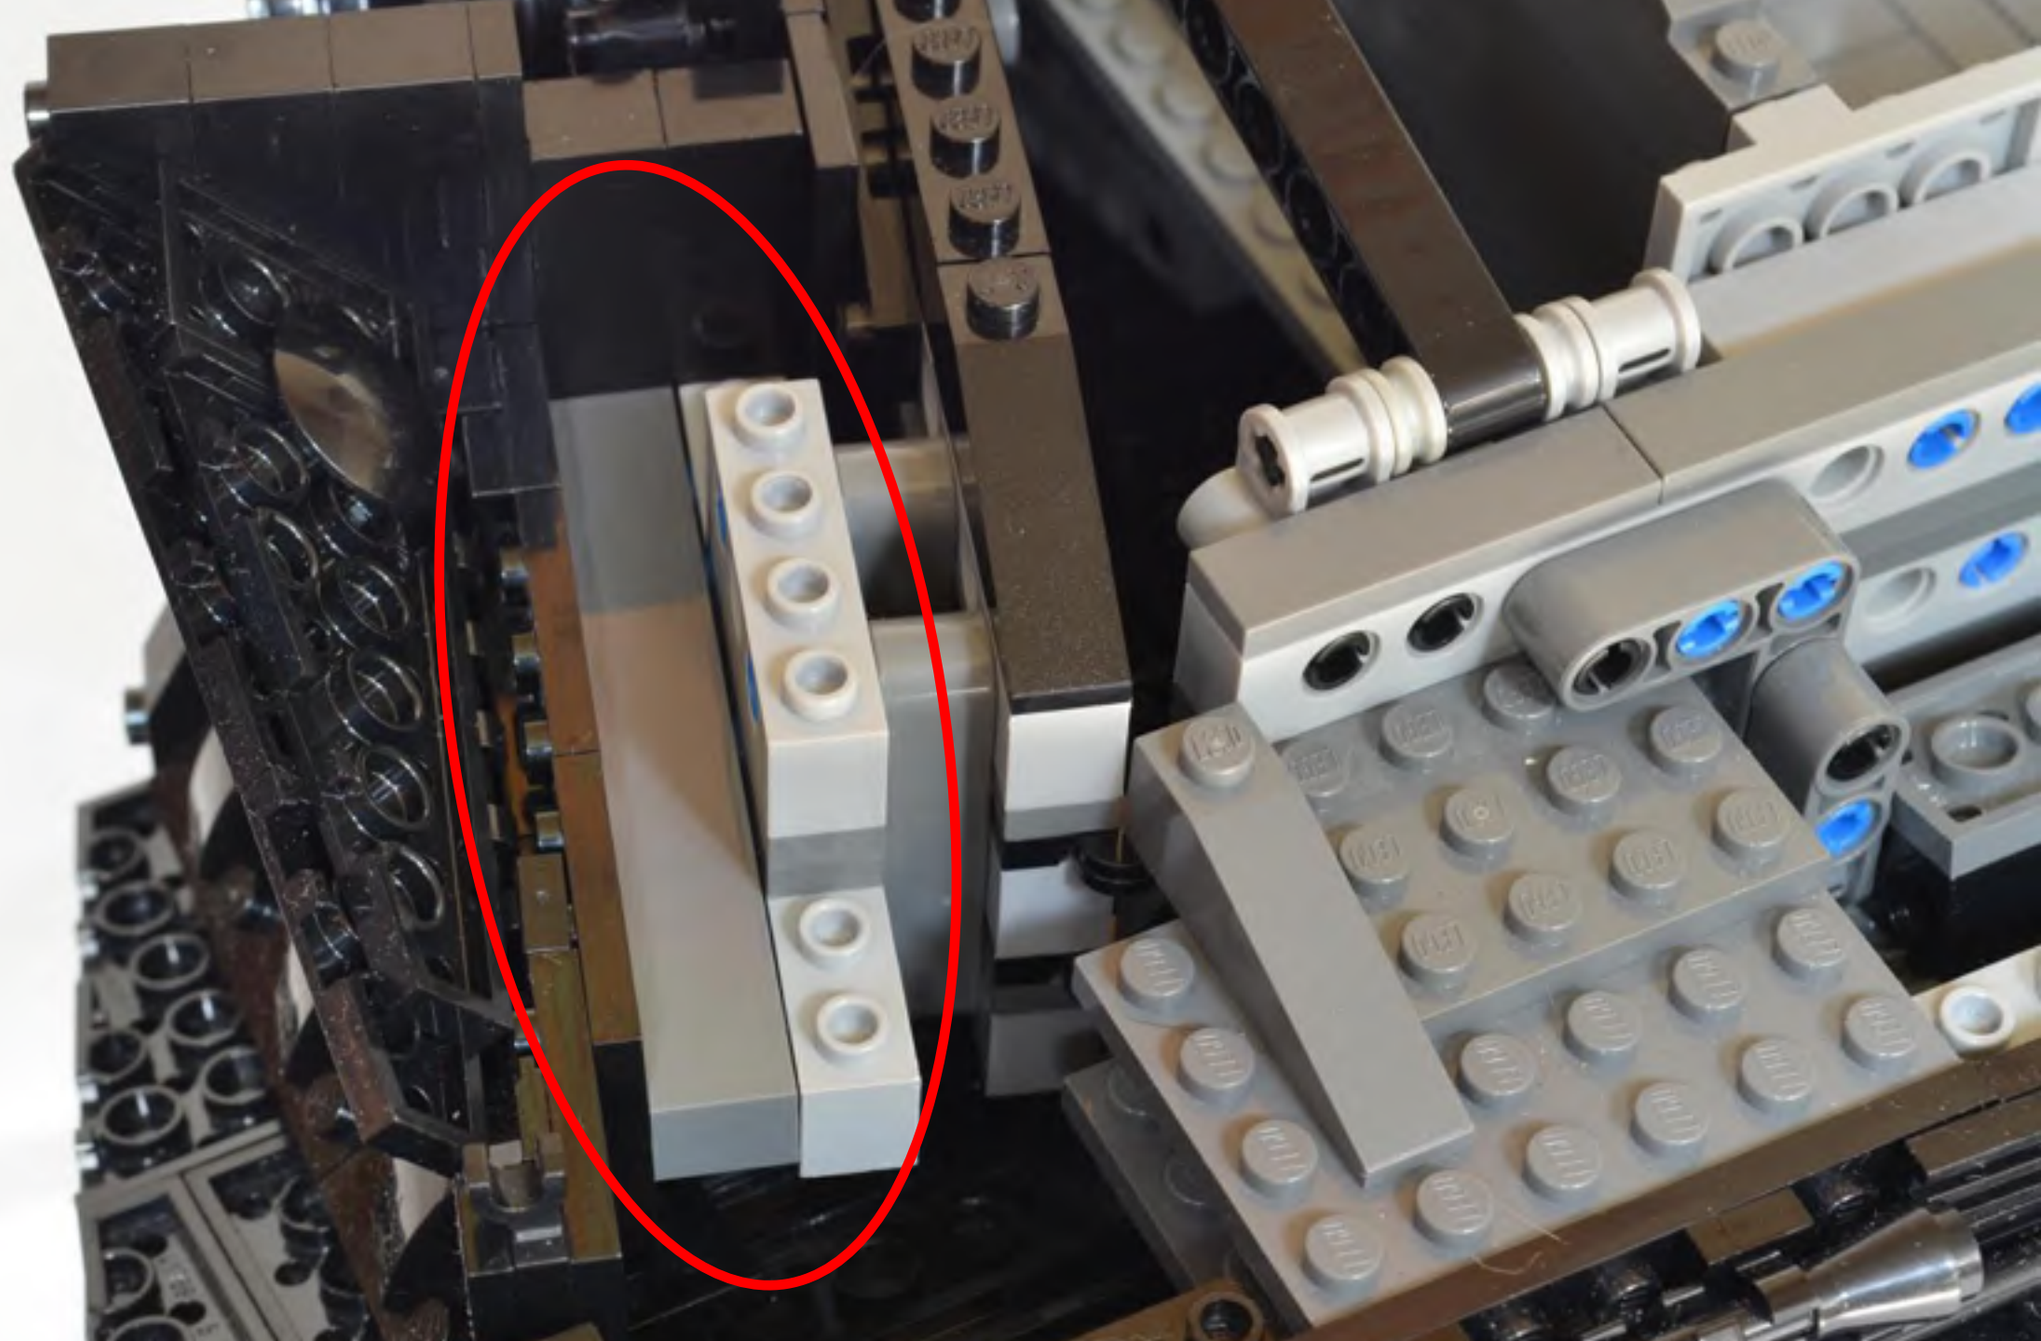


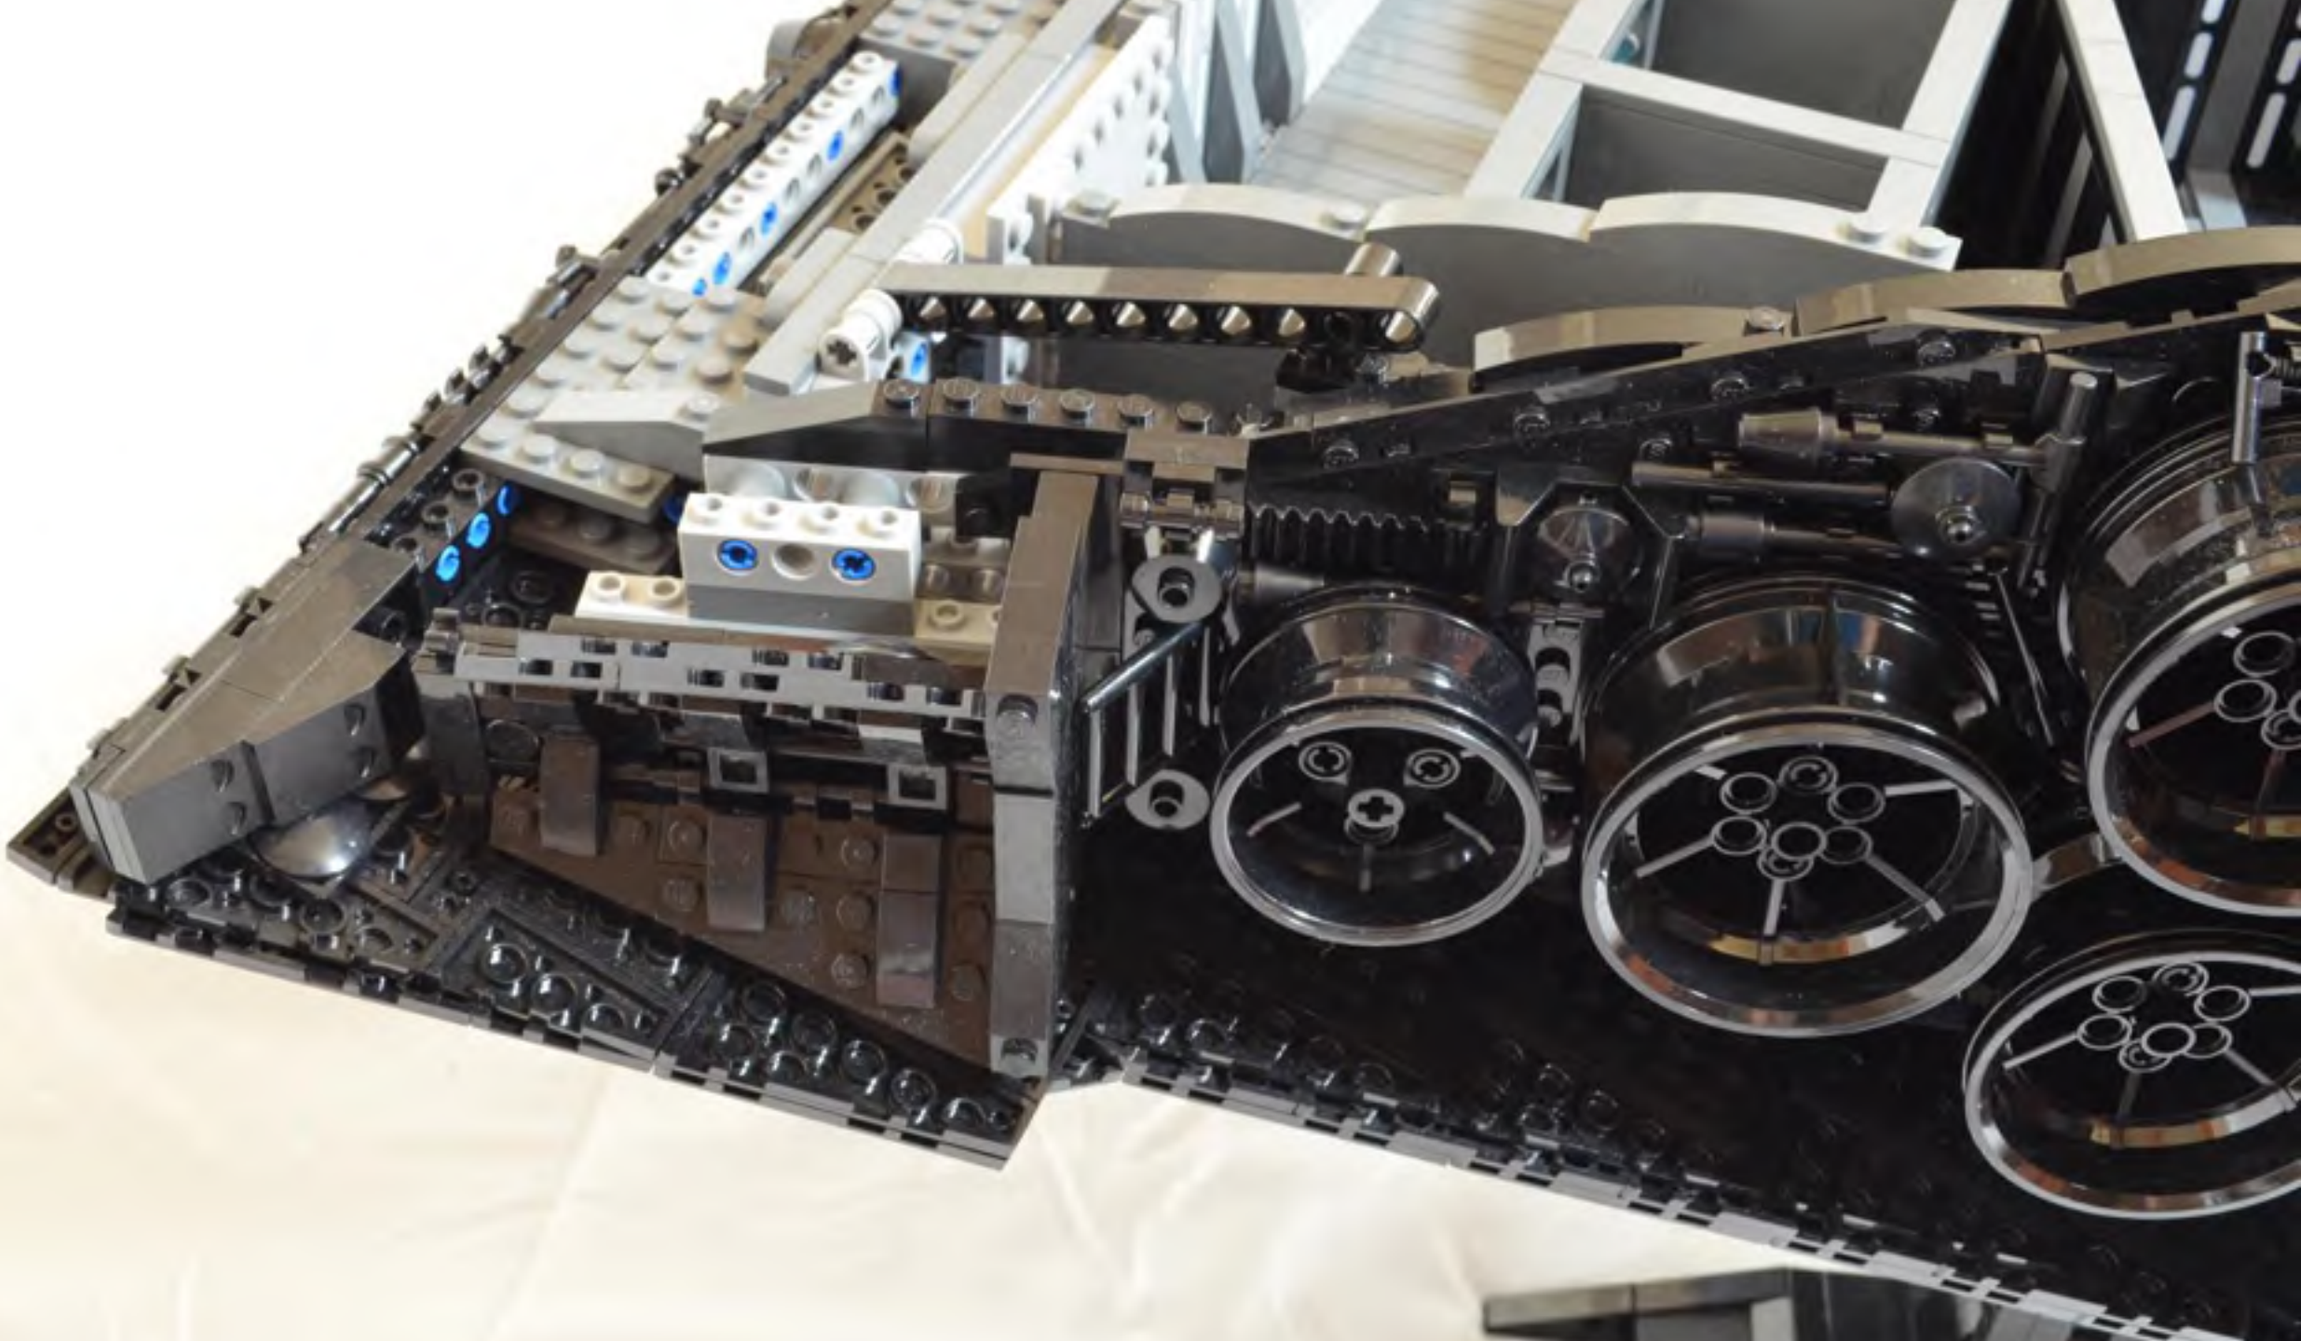


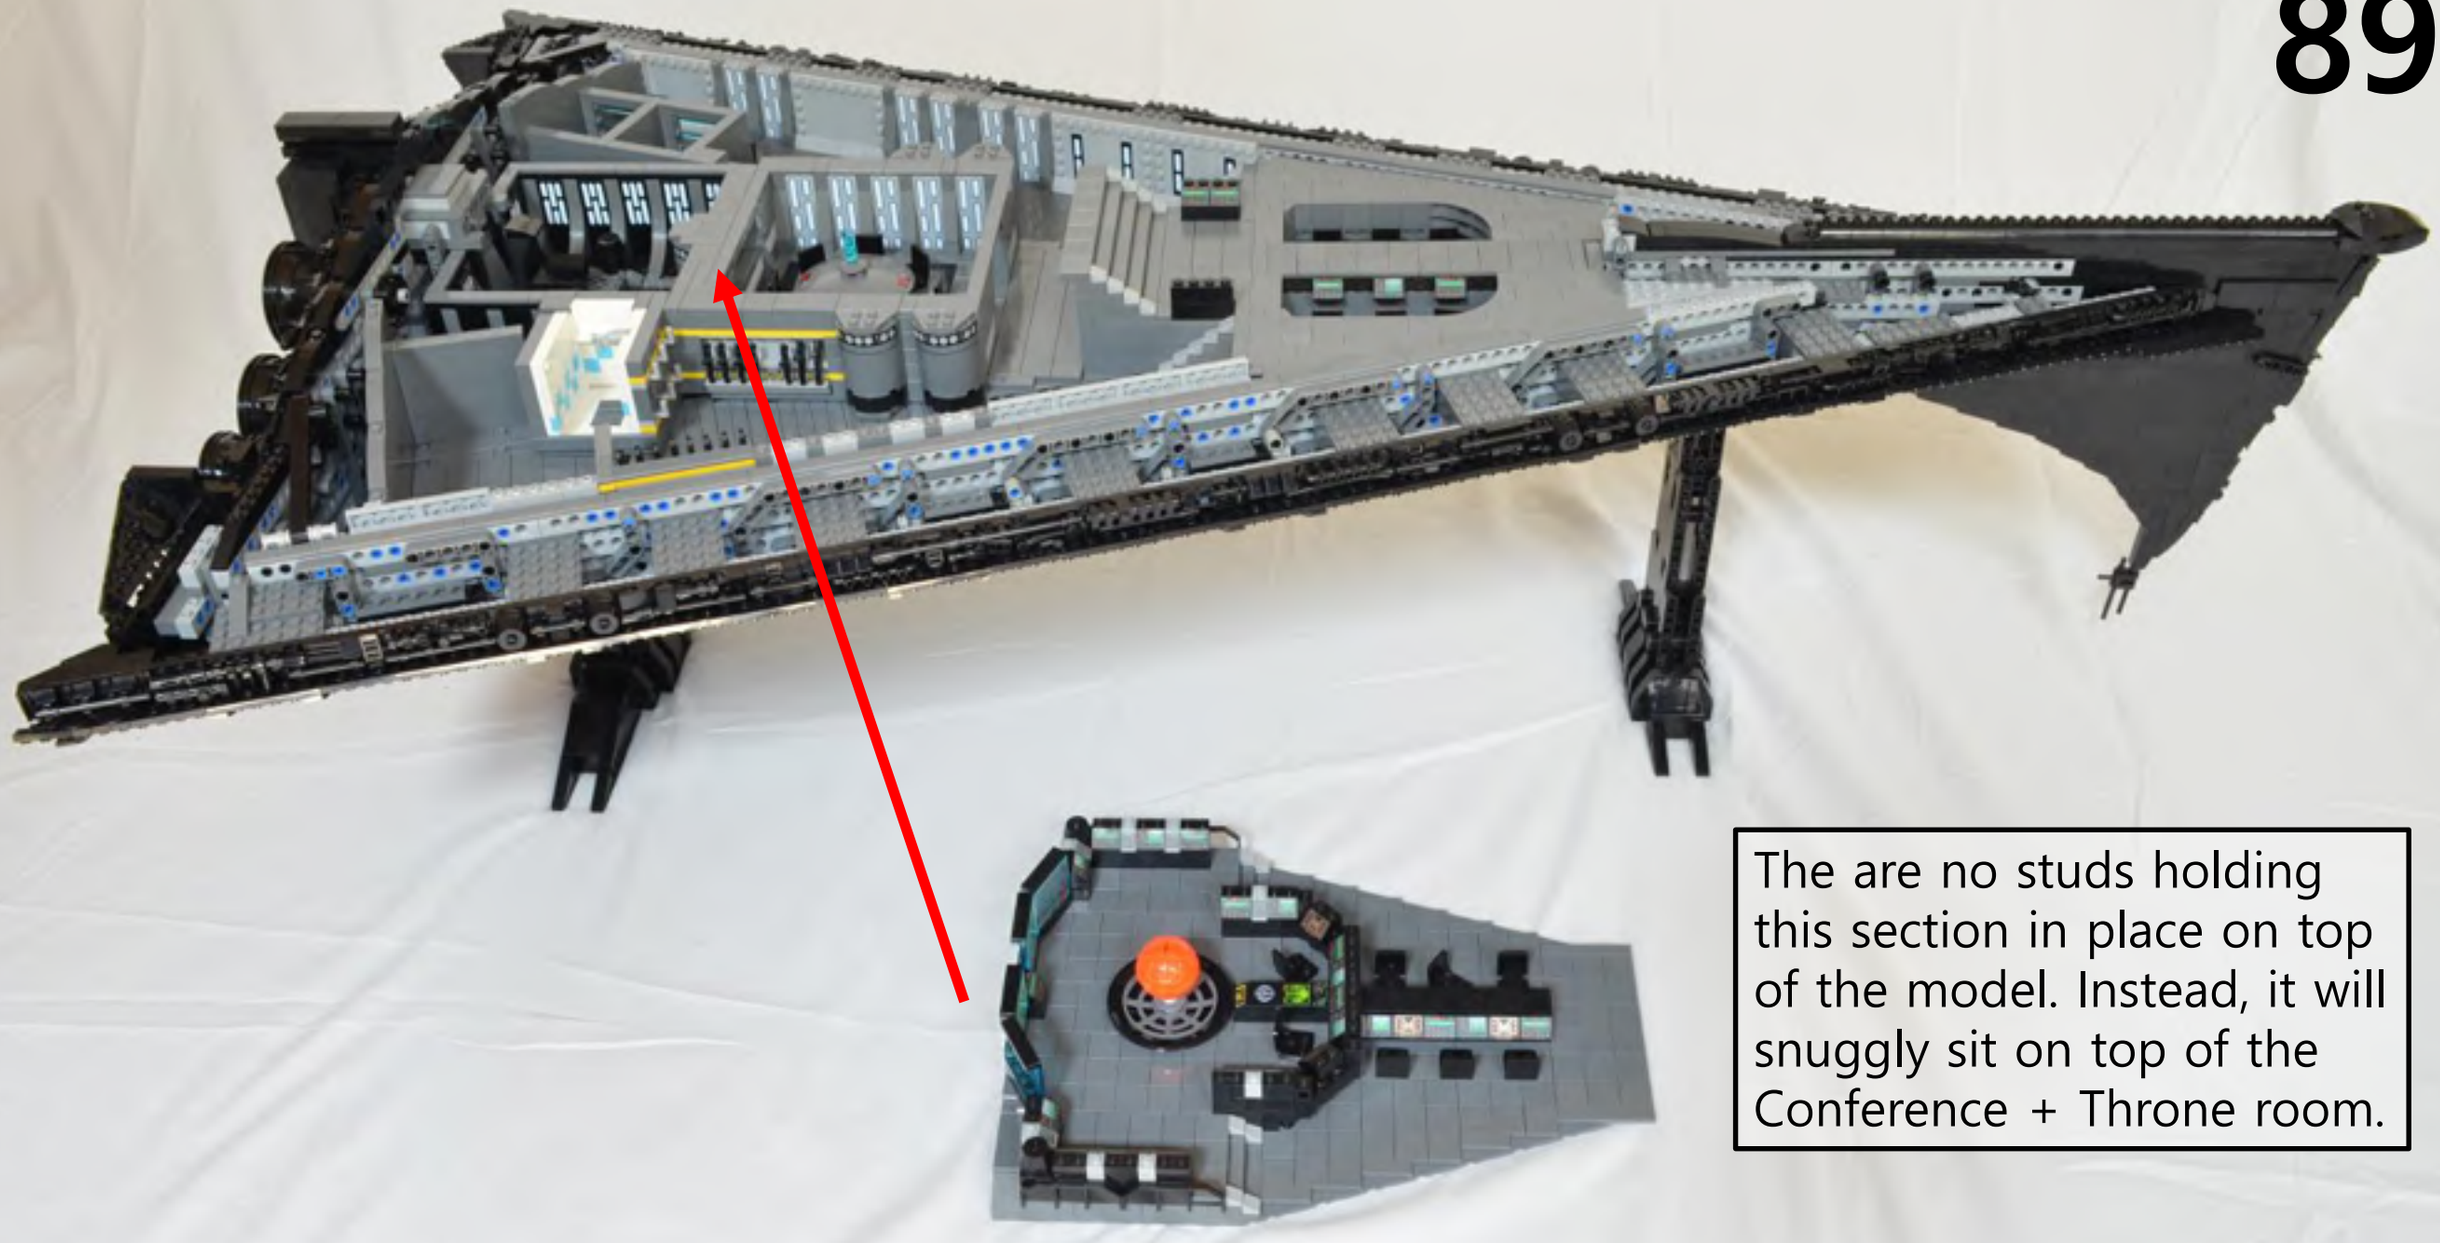
Sticker Placement Reference



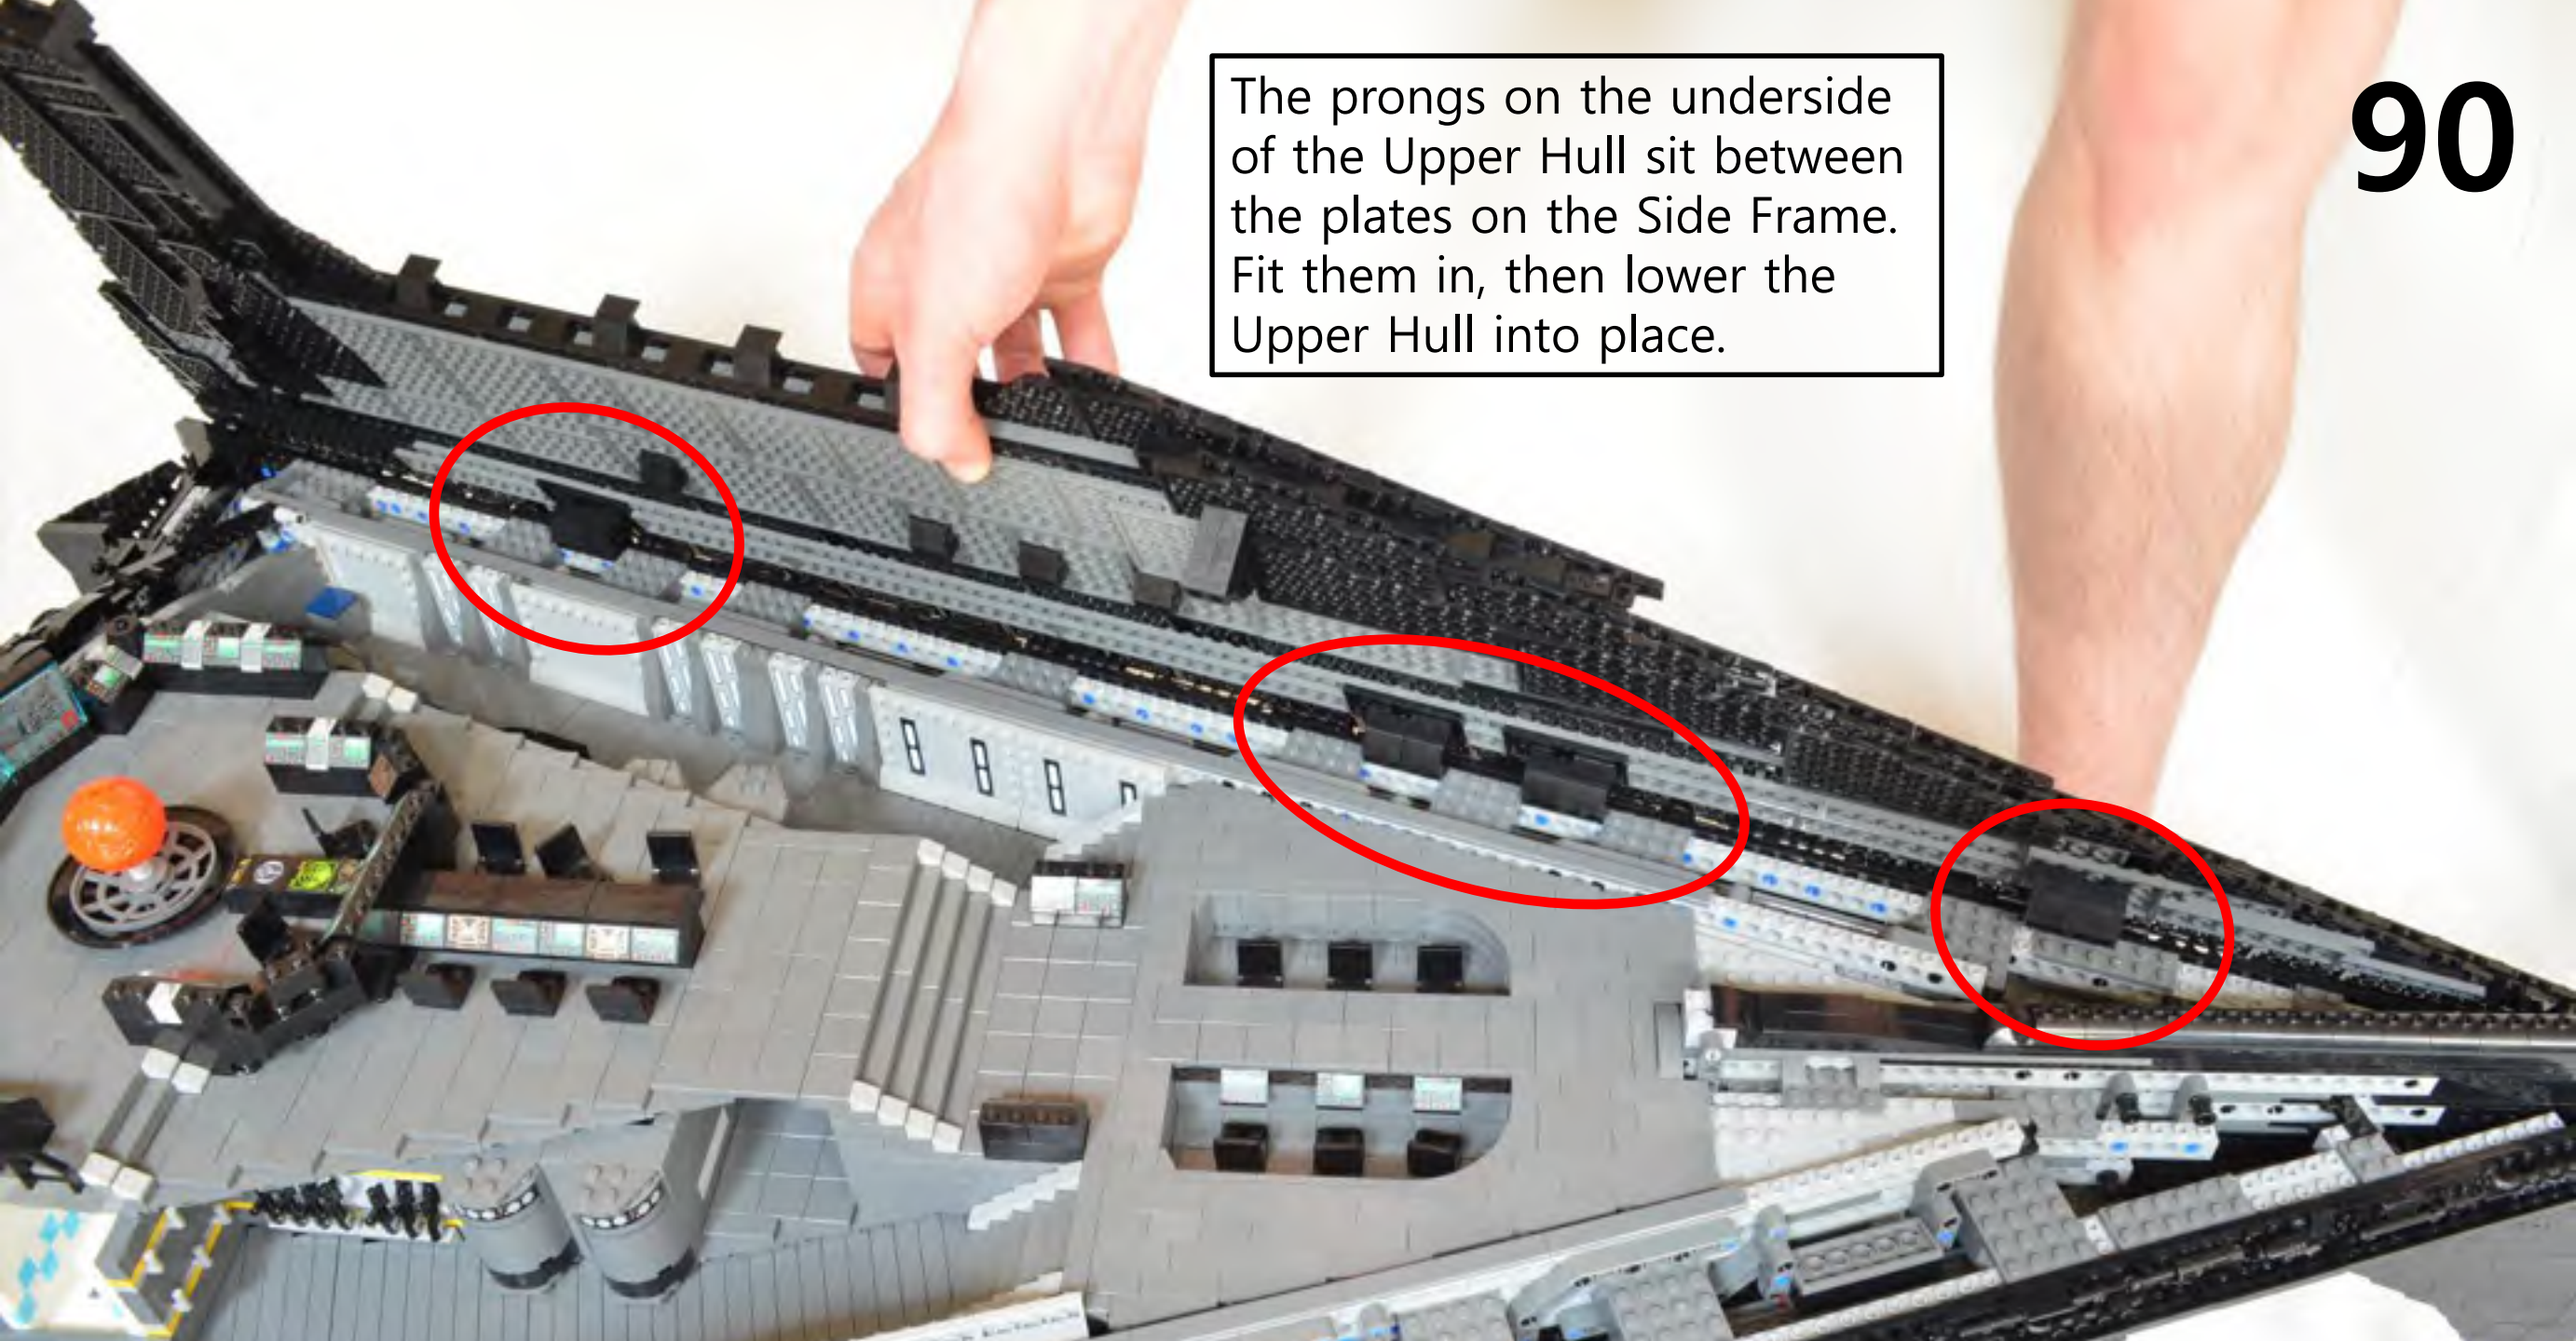




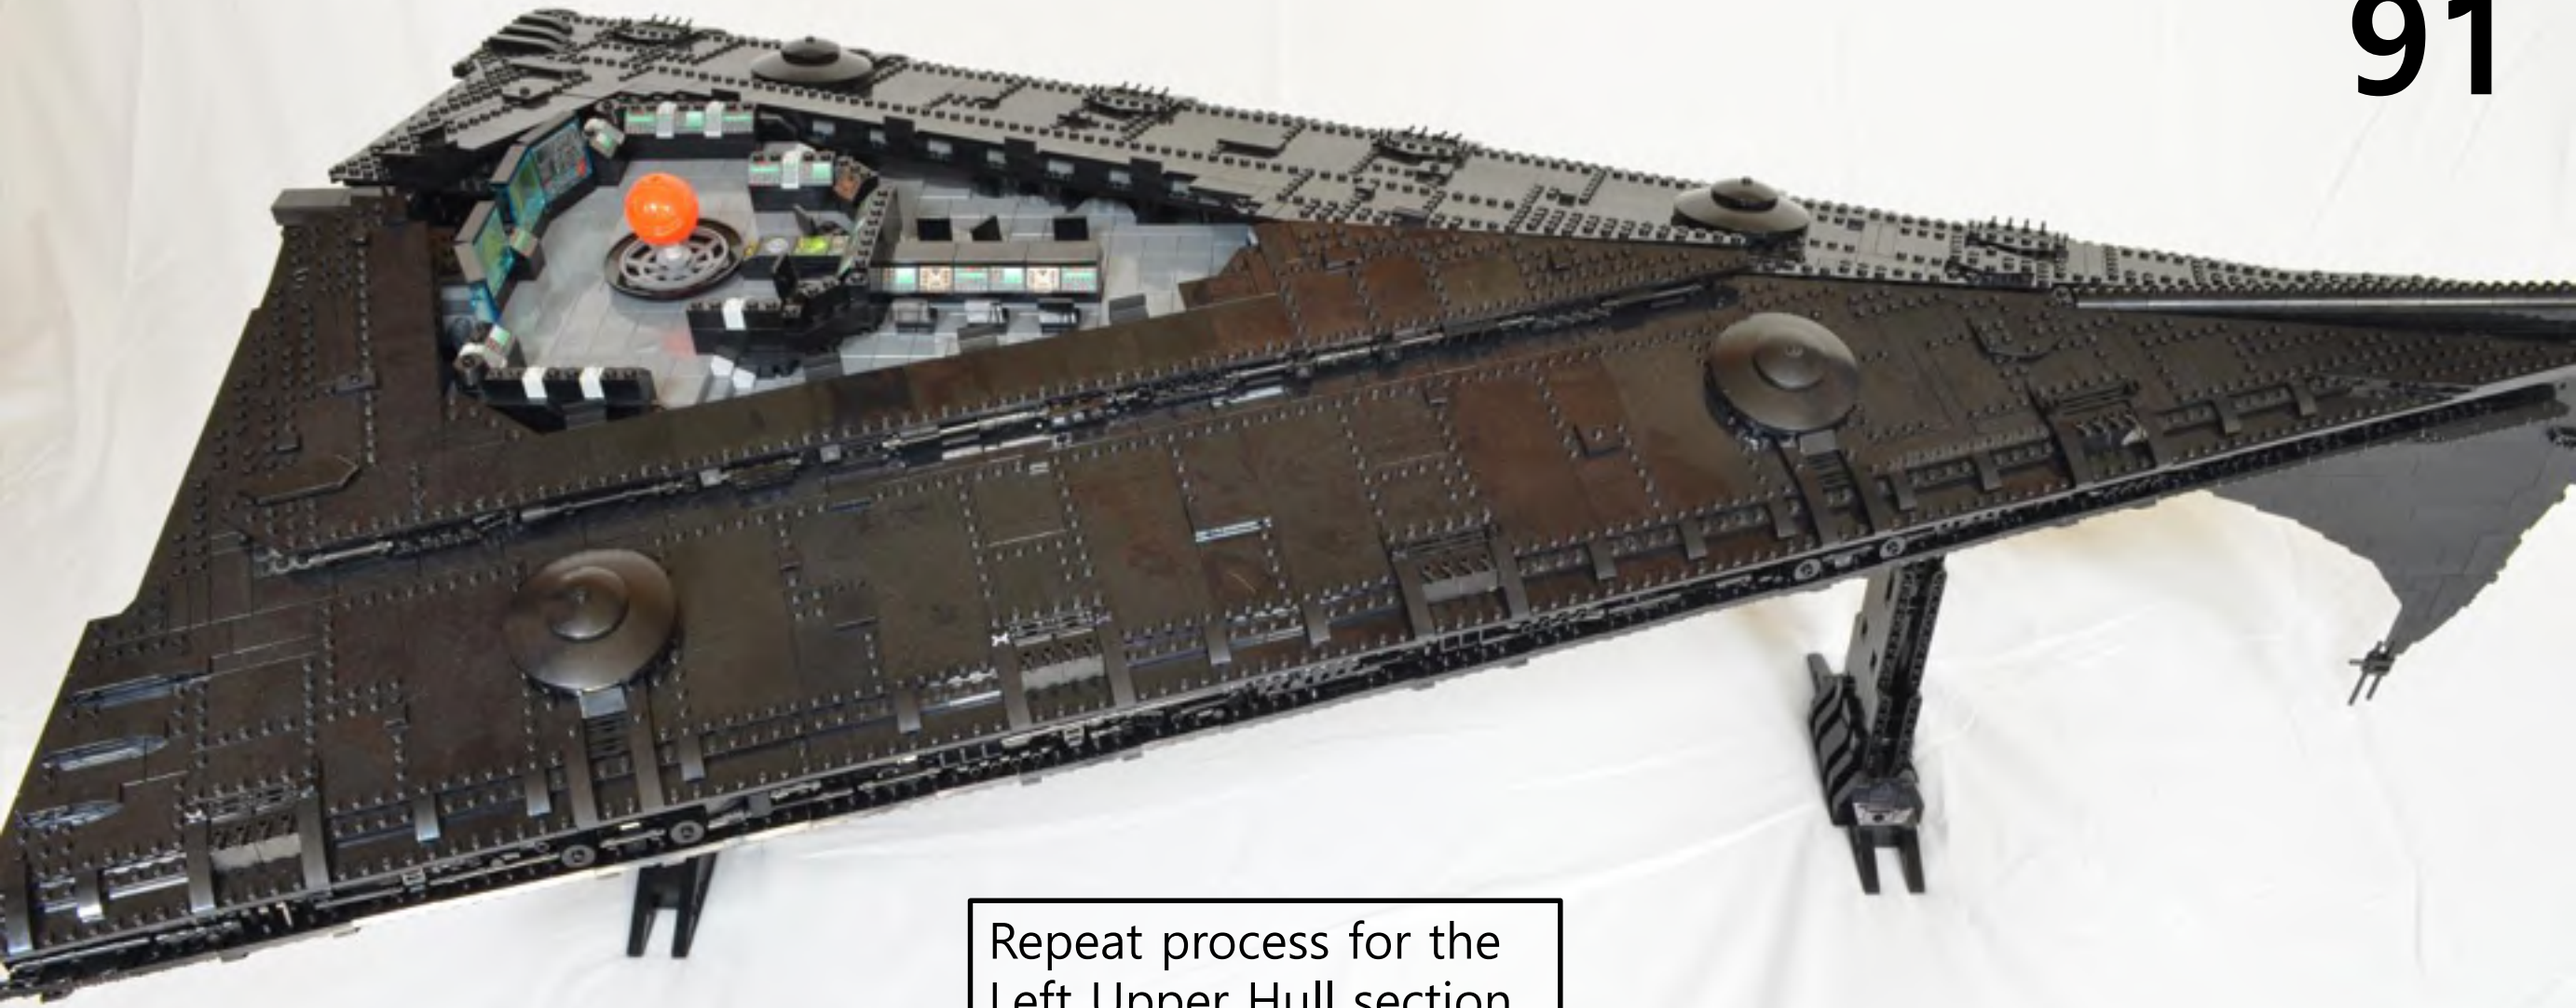




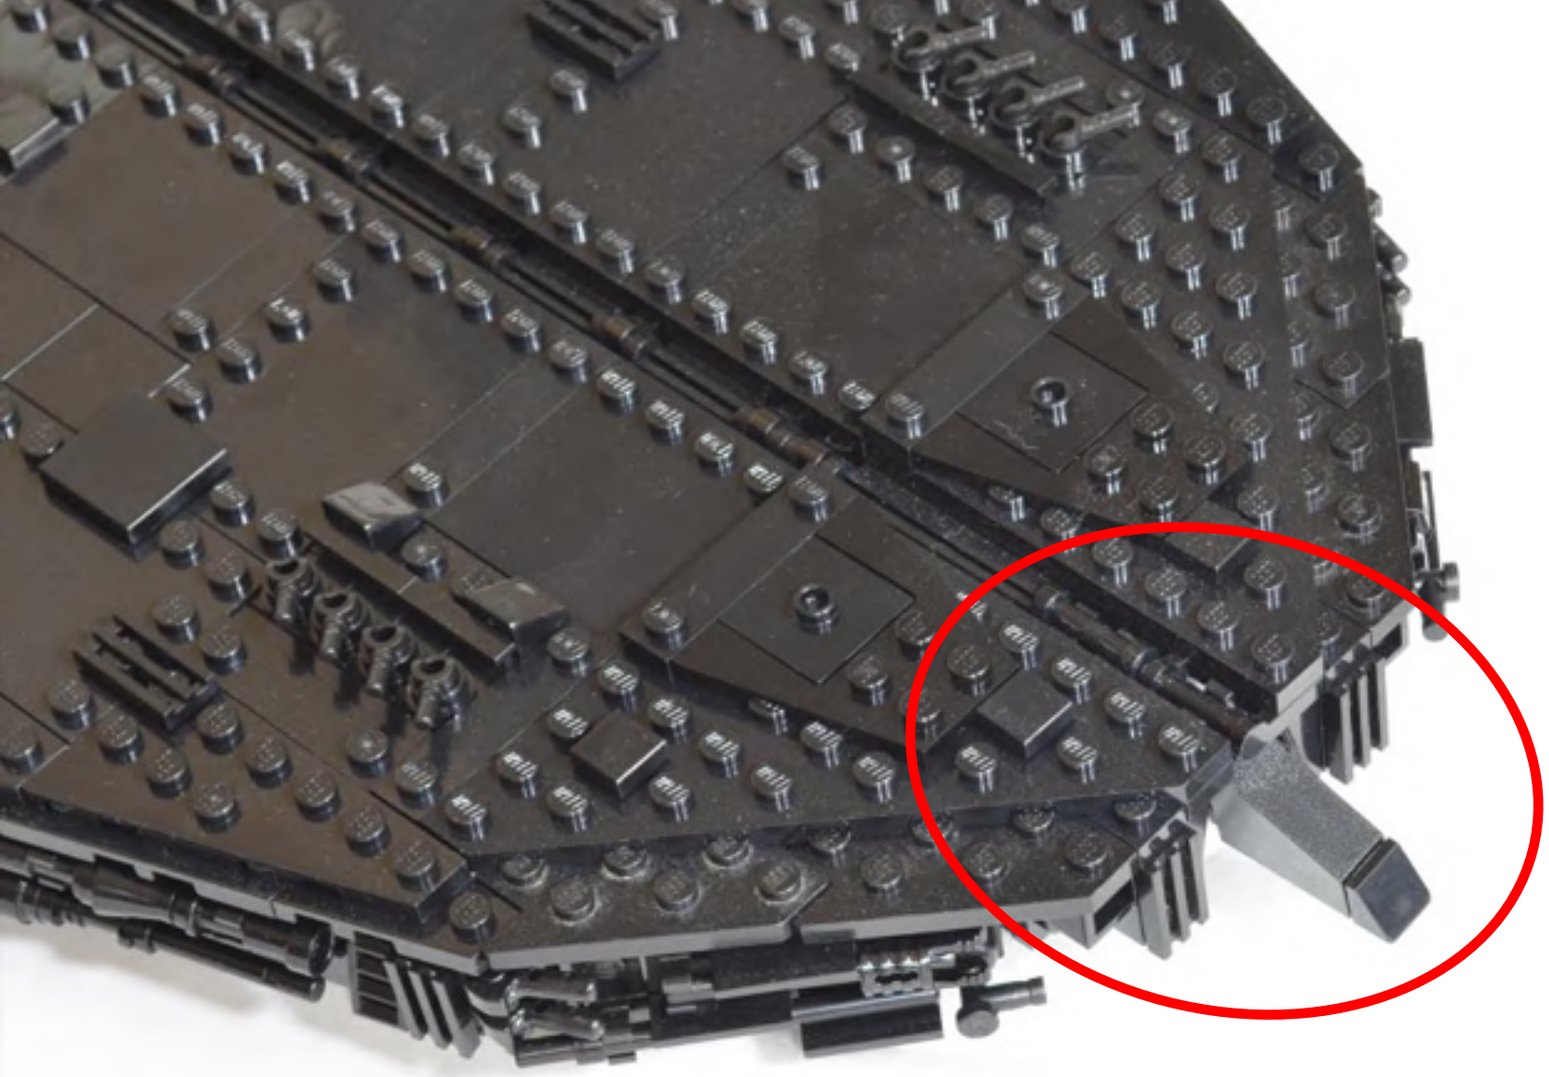
The are no studs holding this section in place on top of the model. Instead, it will snuggly sit on top of the Conference + Throne room.

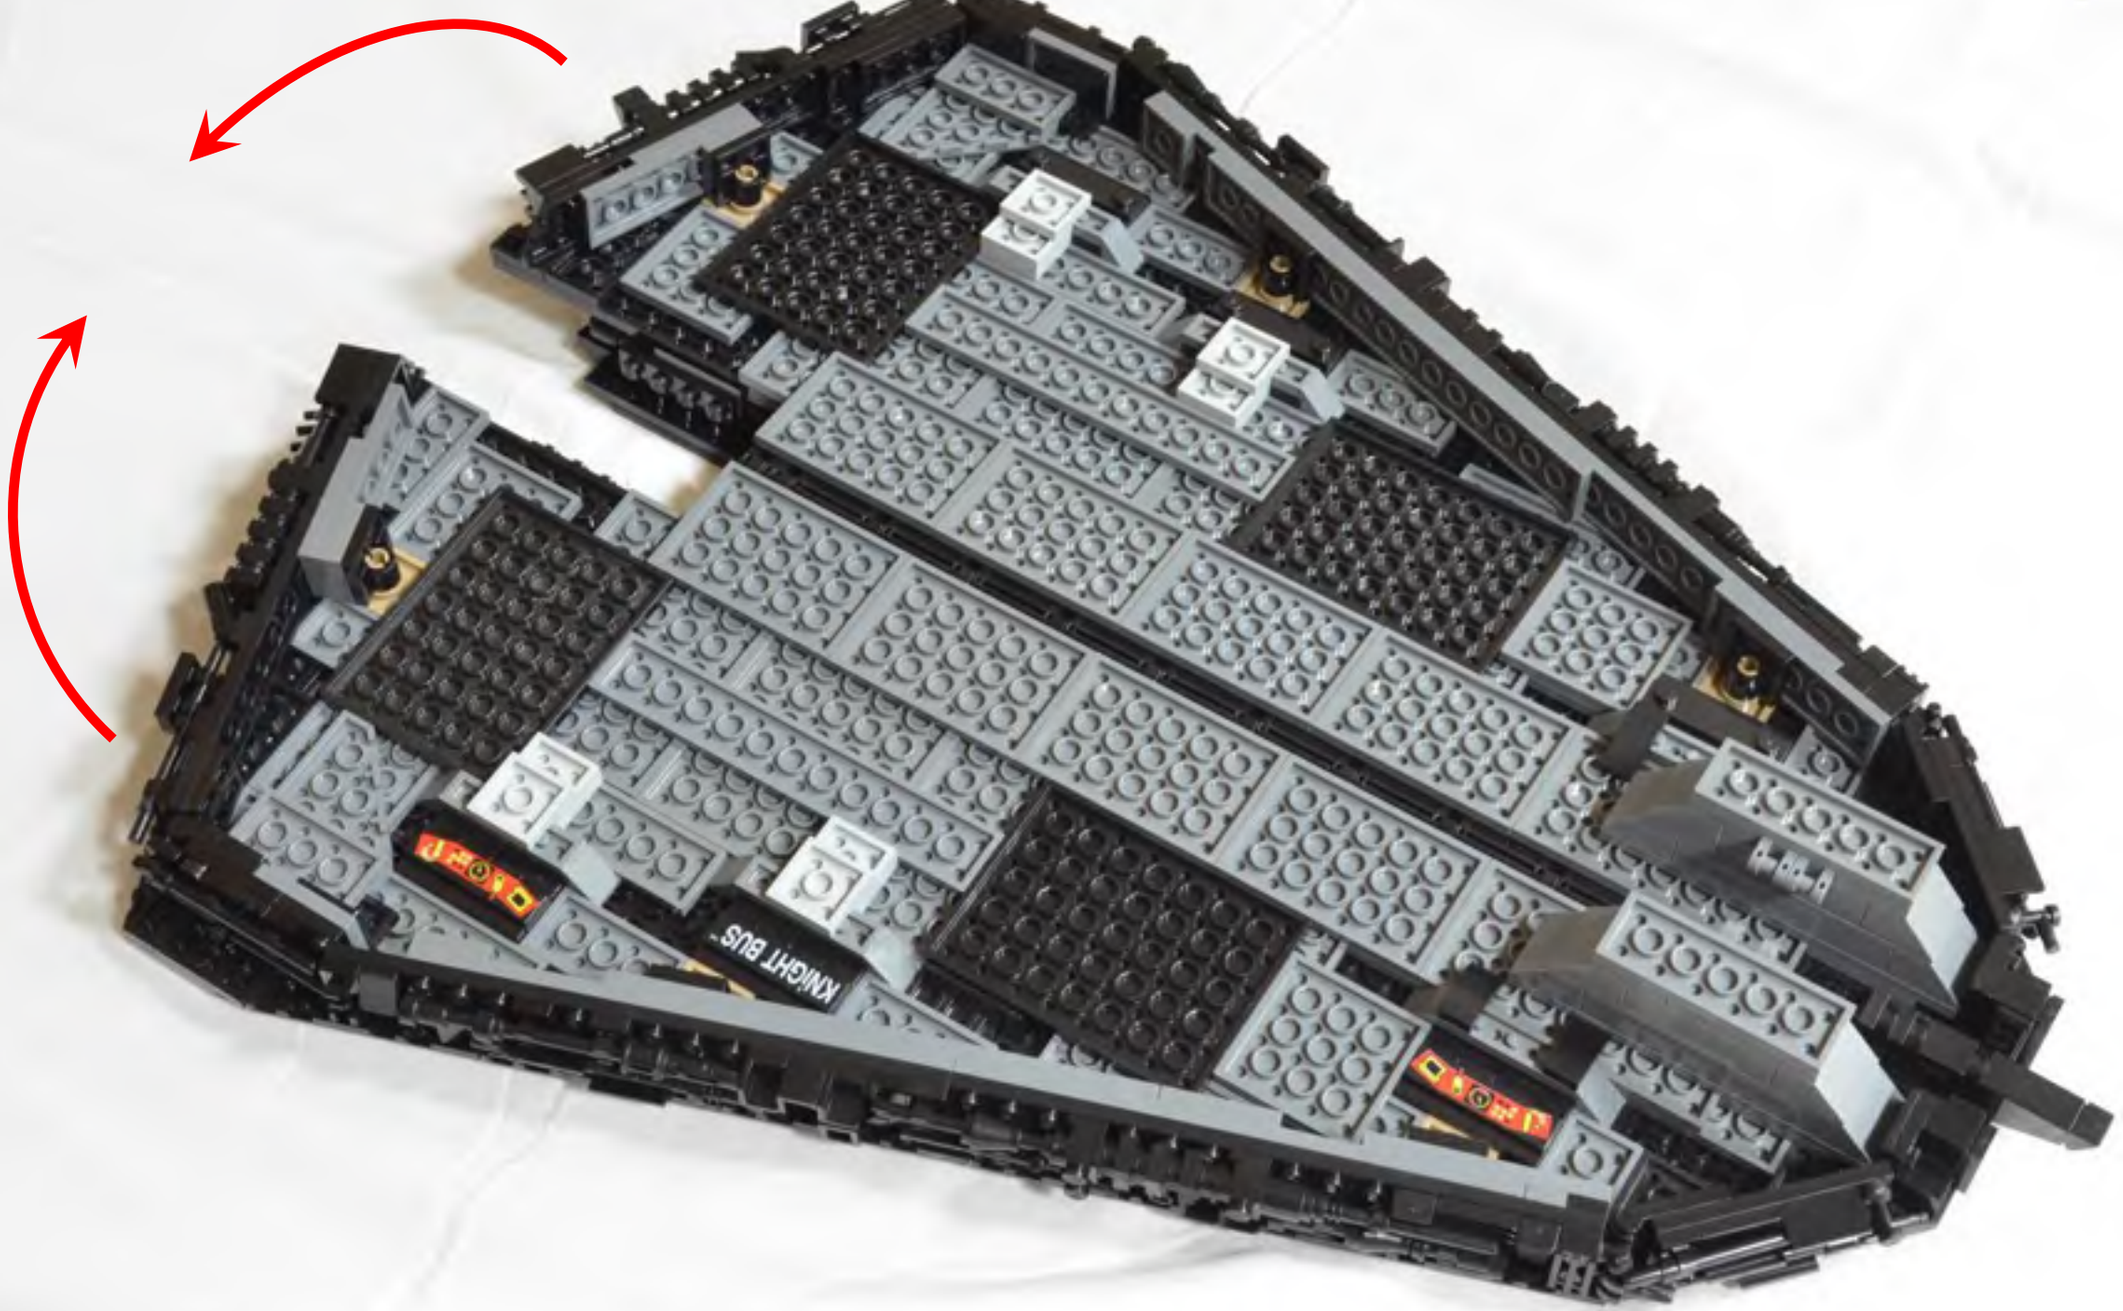


The prongs on the underside of the Upper Hull sit between the plates on the Side Frame. Fit them in, then lower the Upper Hull into place.

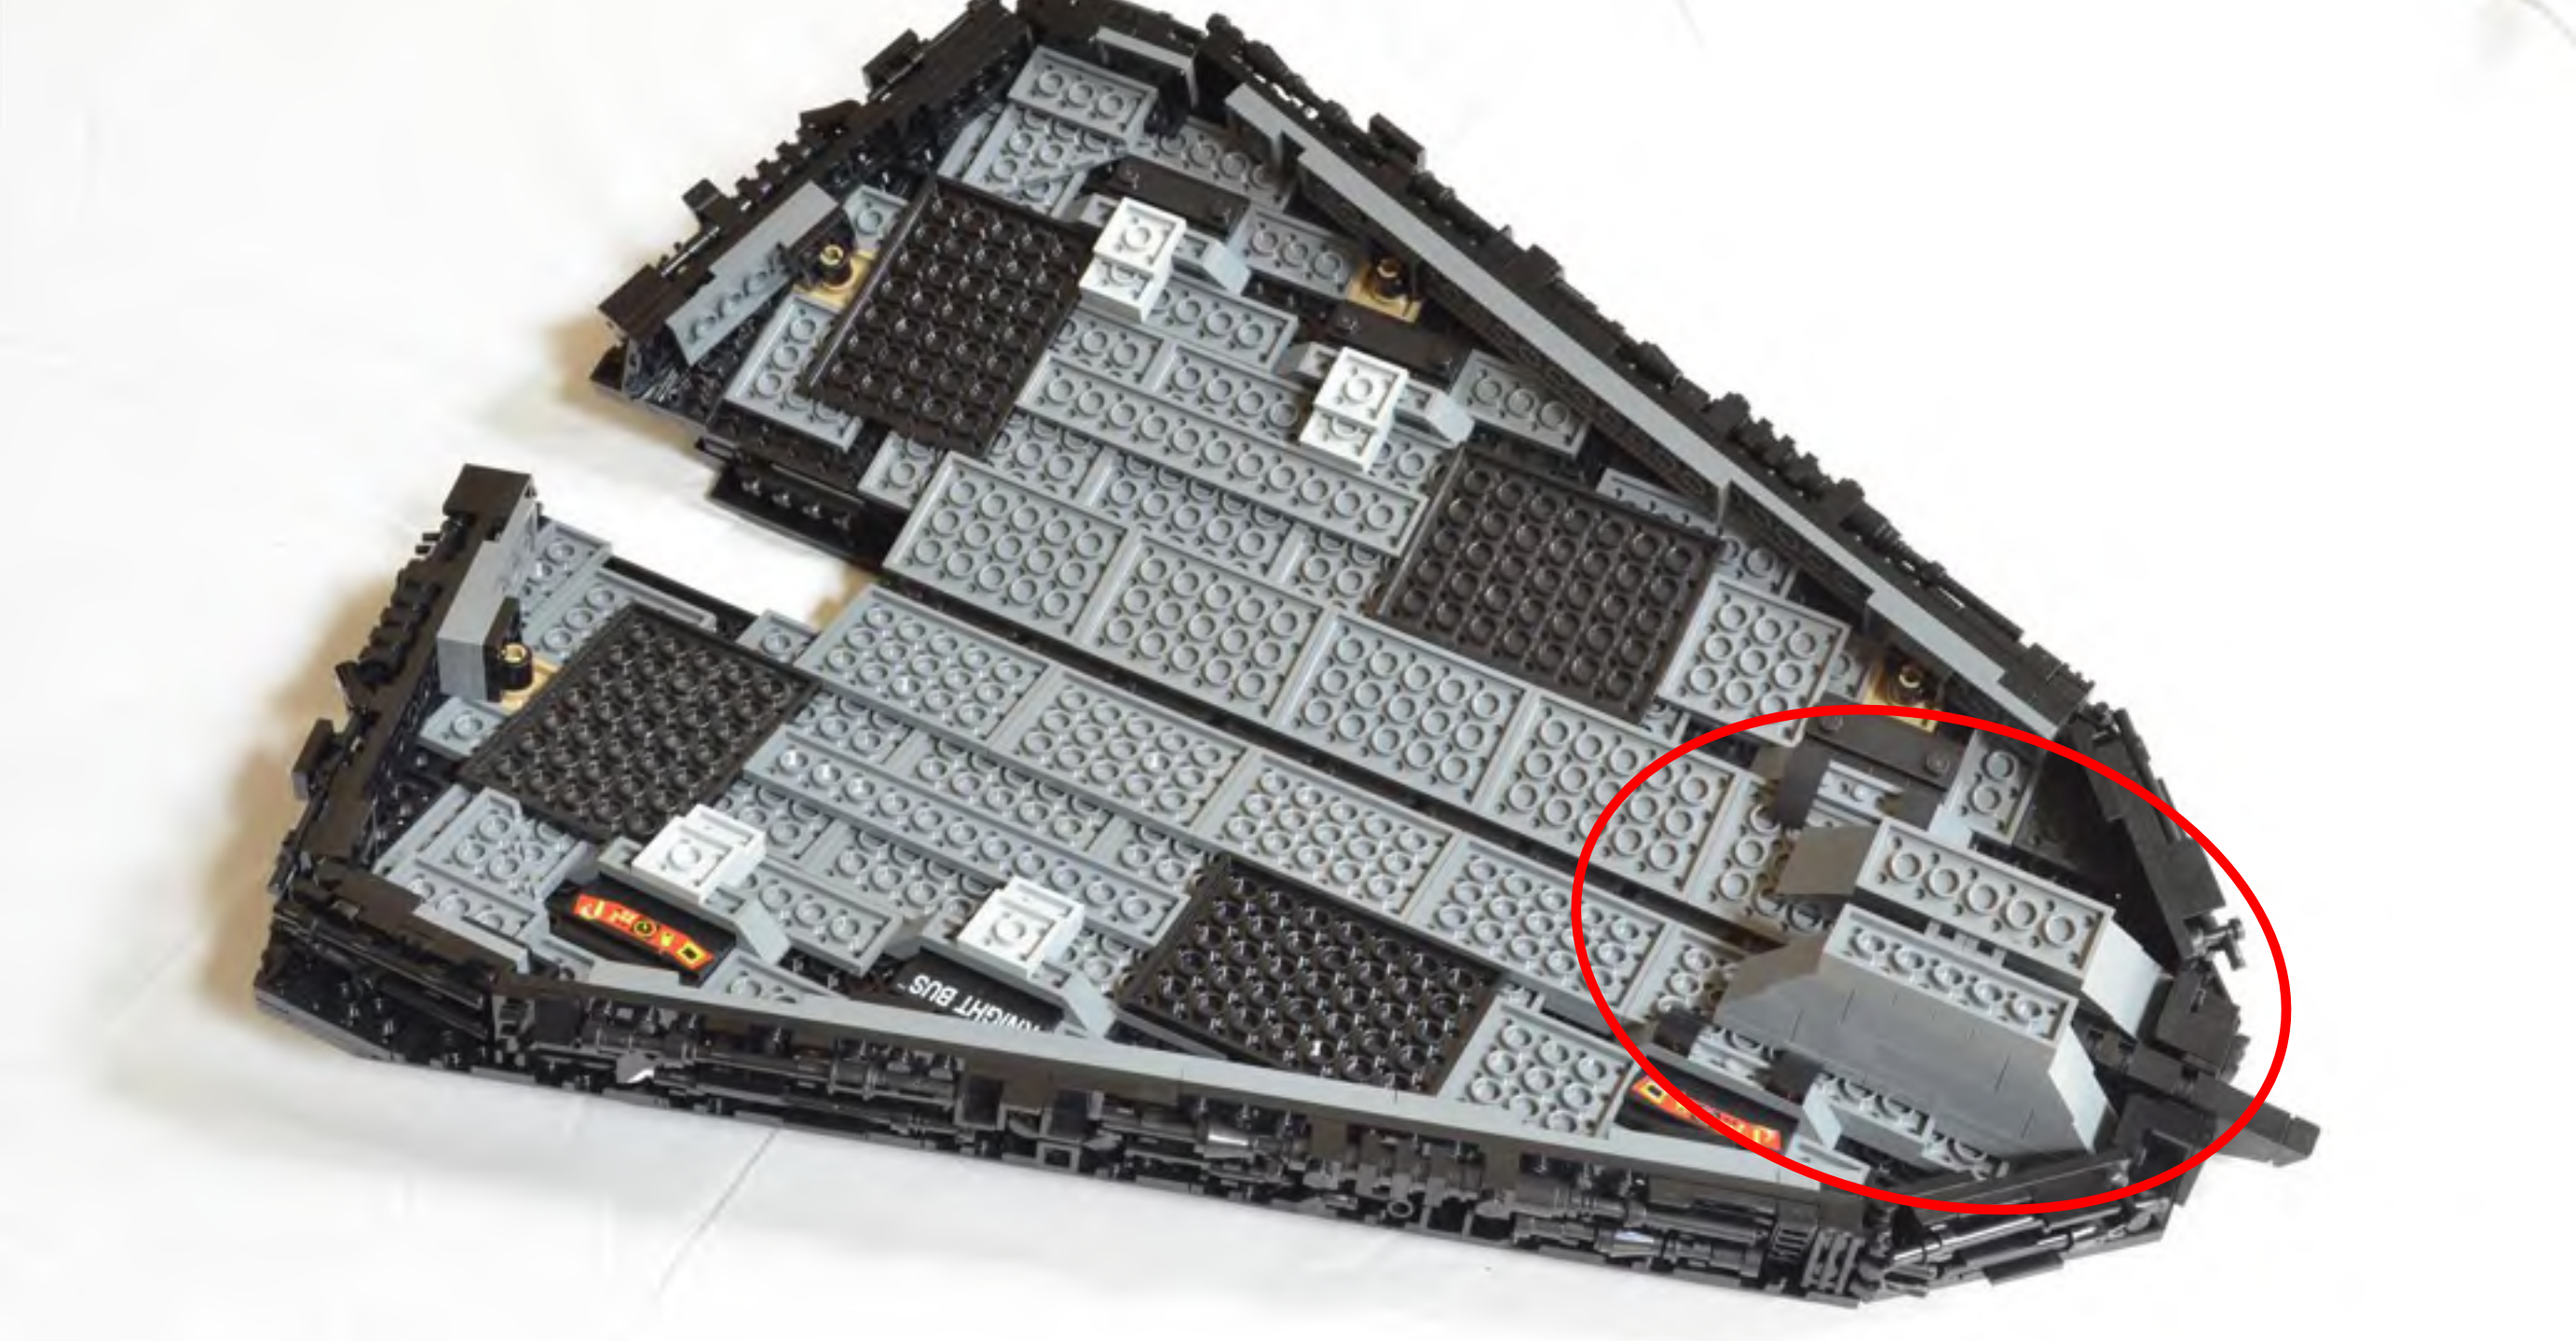


Repeat process for the
Left Upper Hull section.

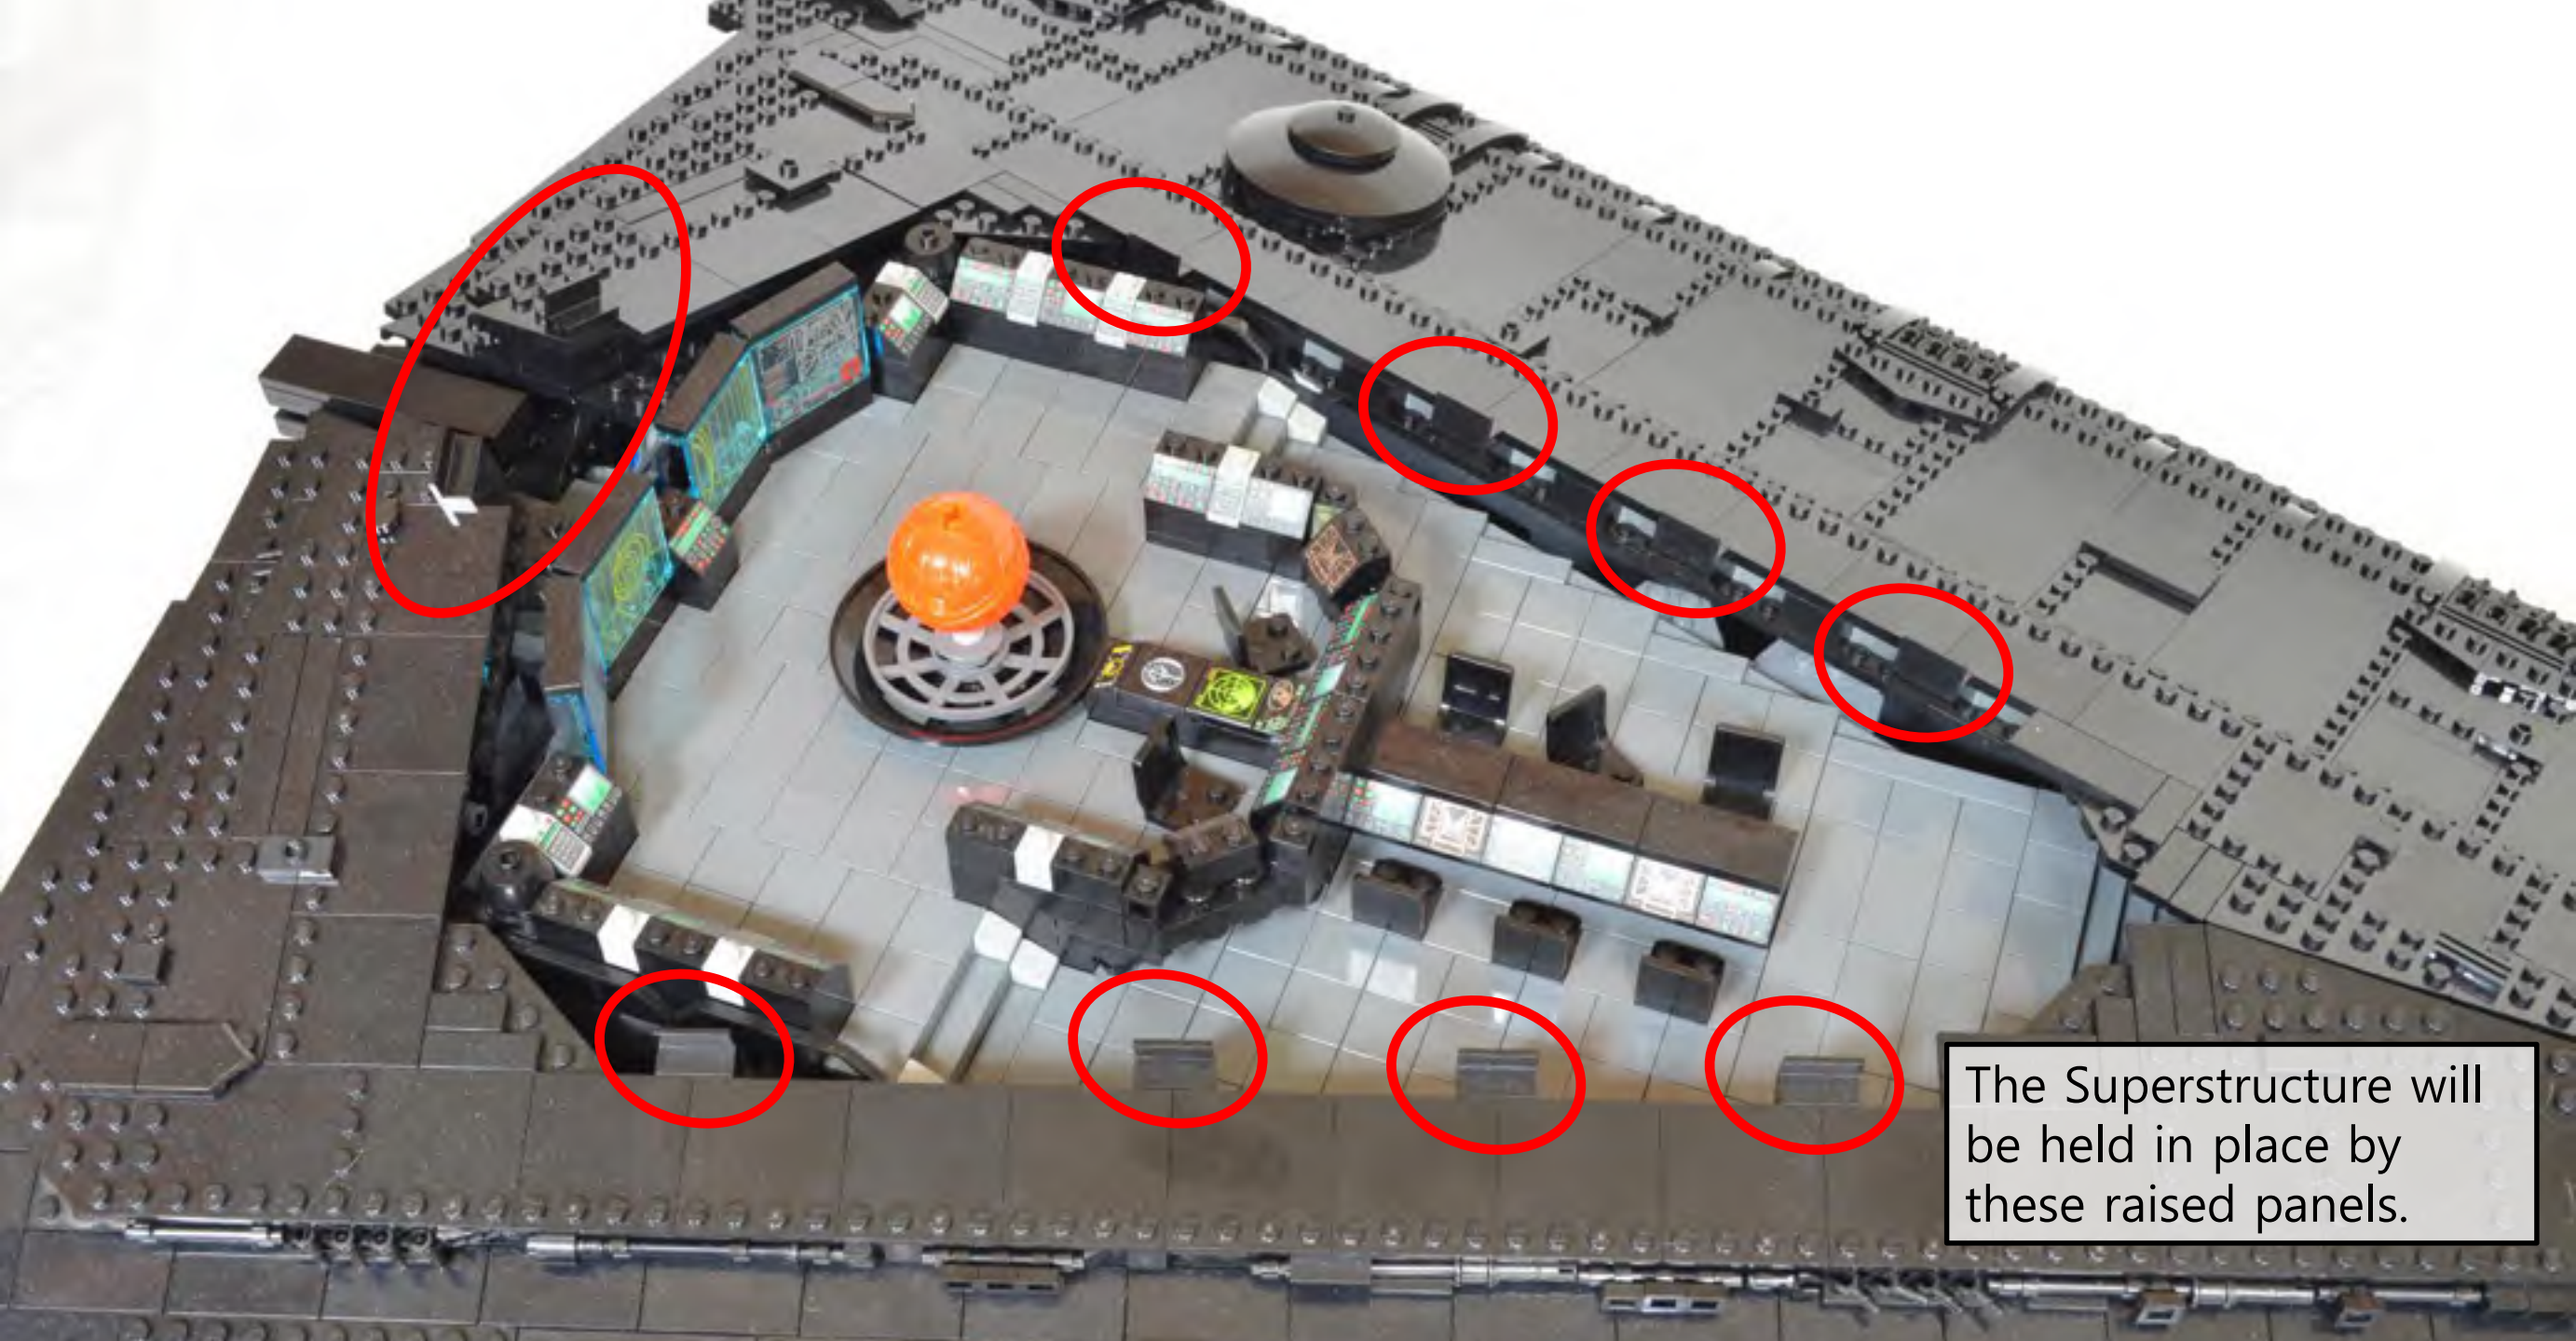




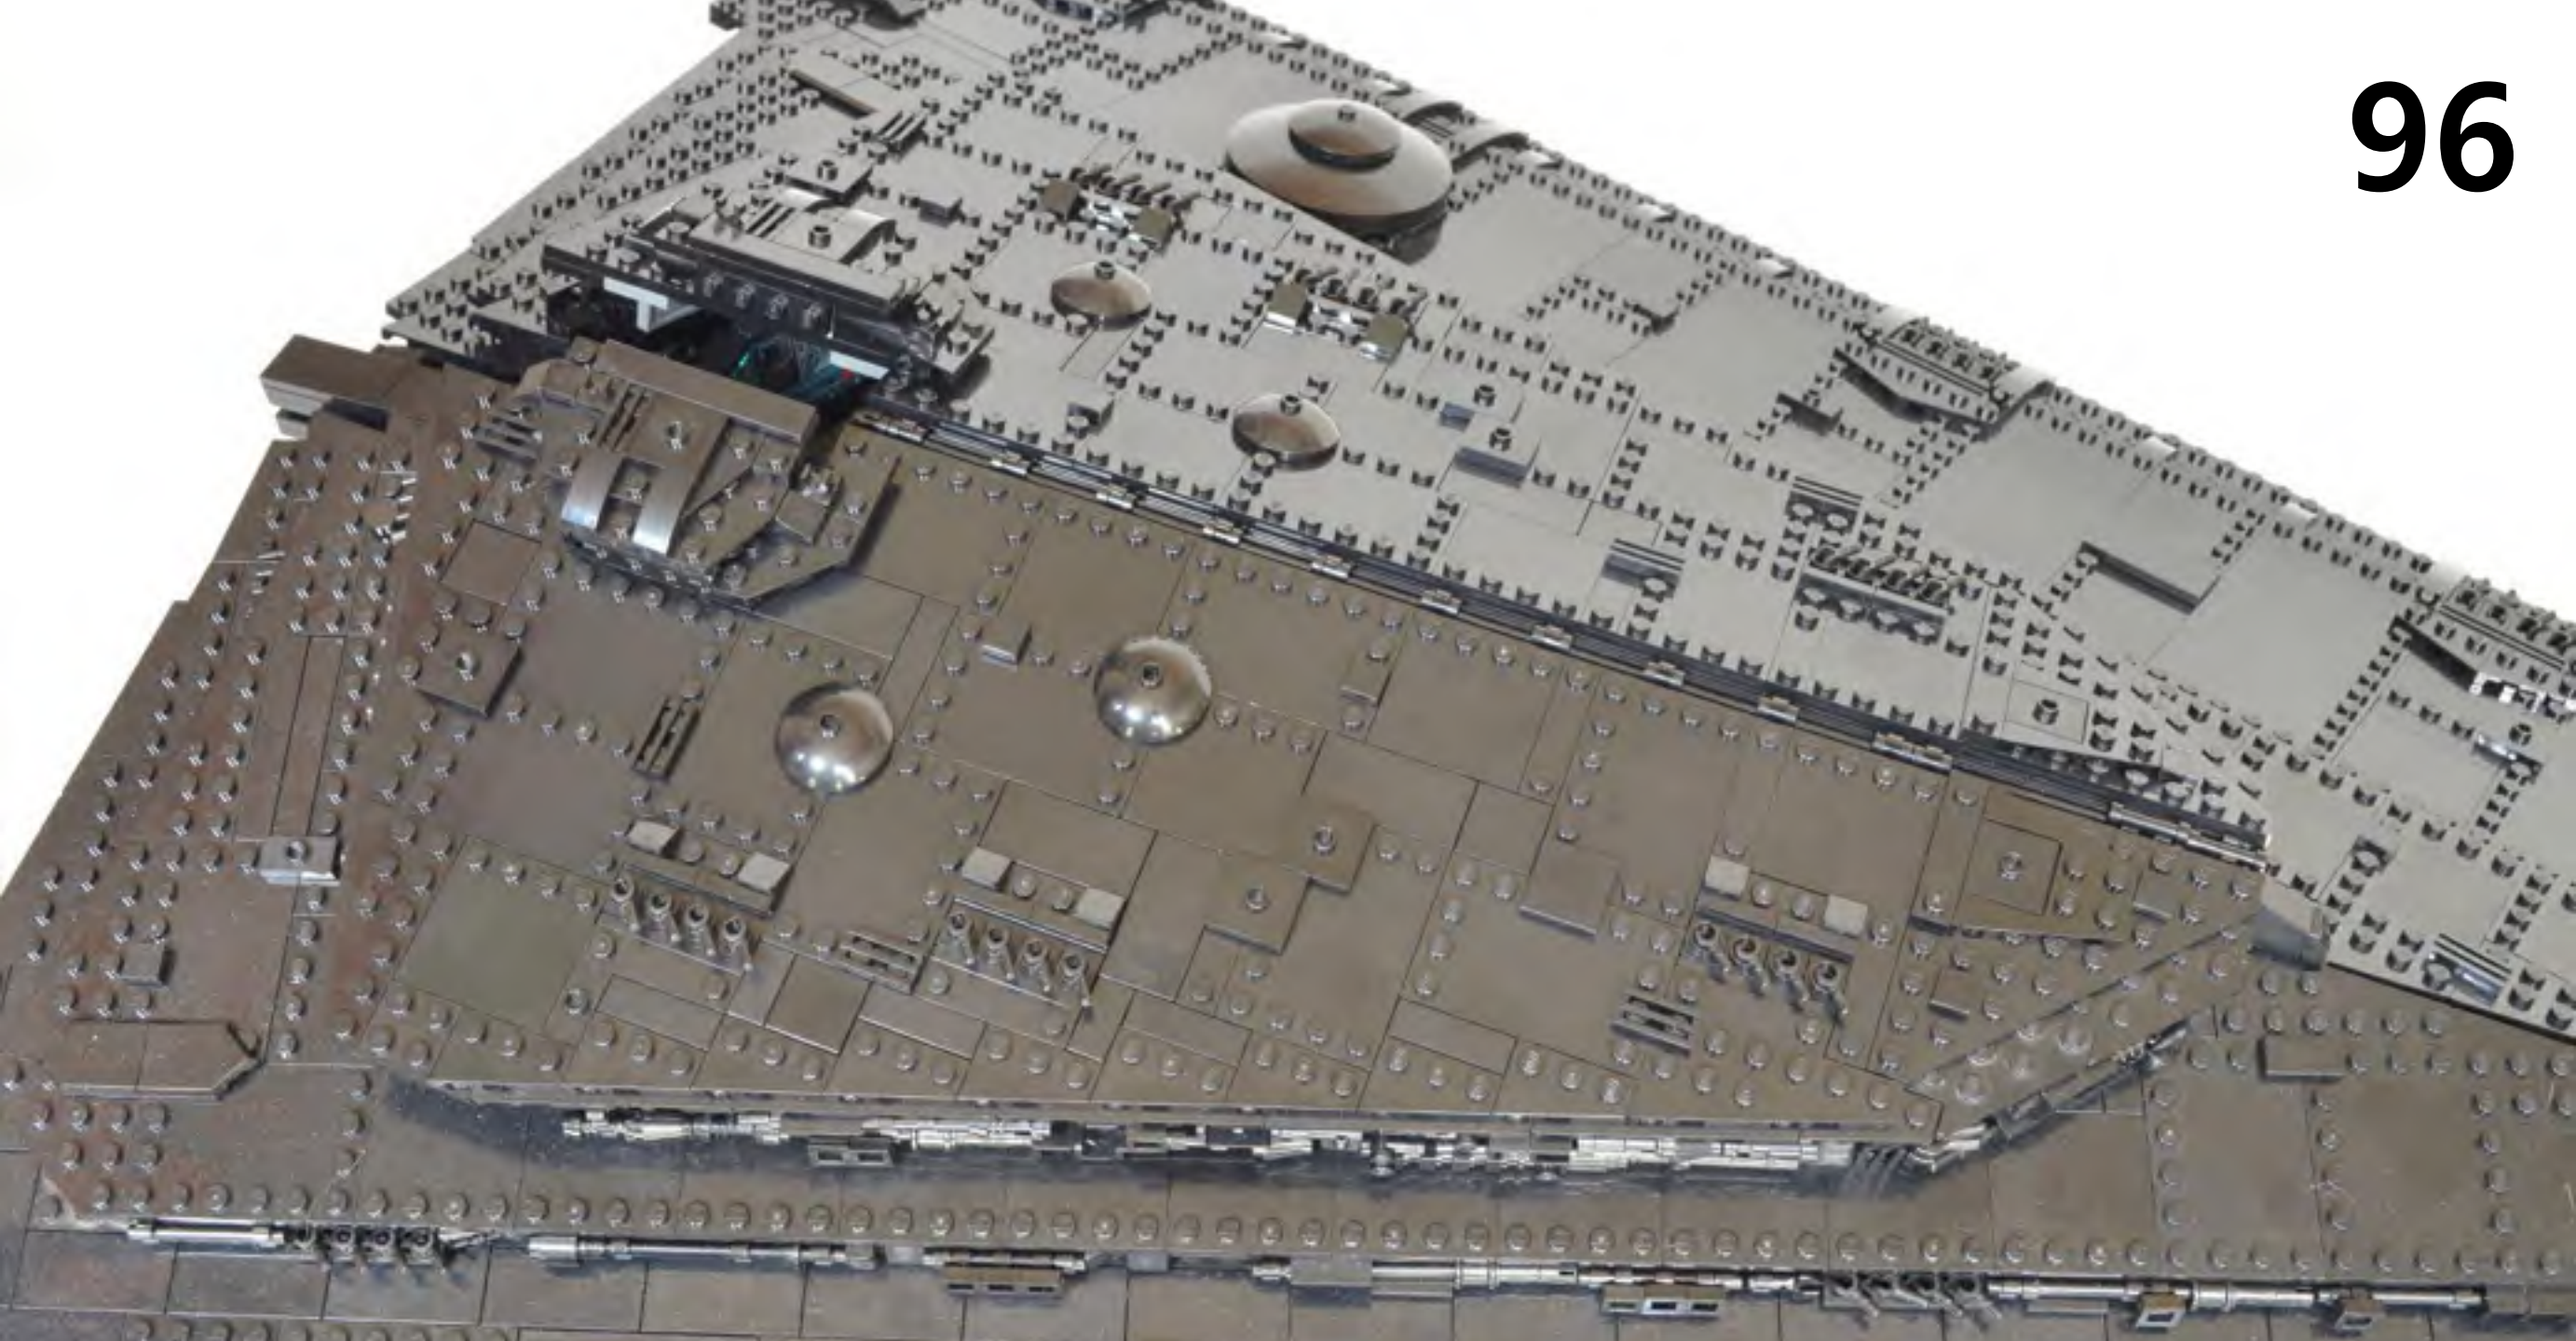
KNIGHT BUS

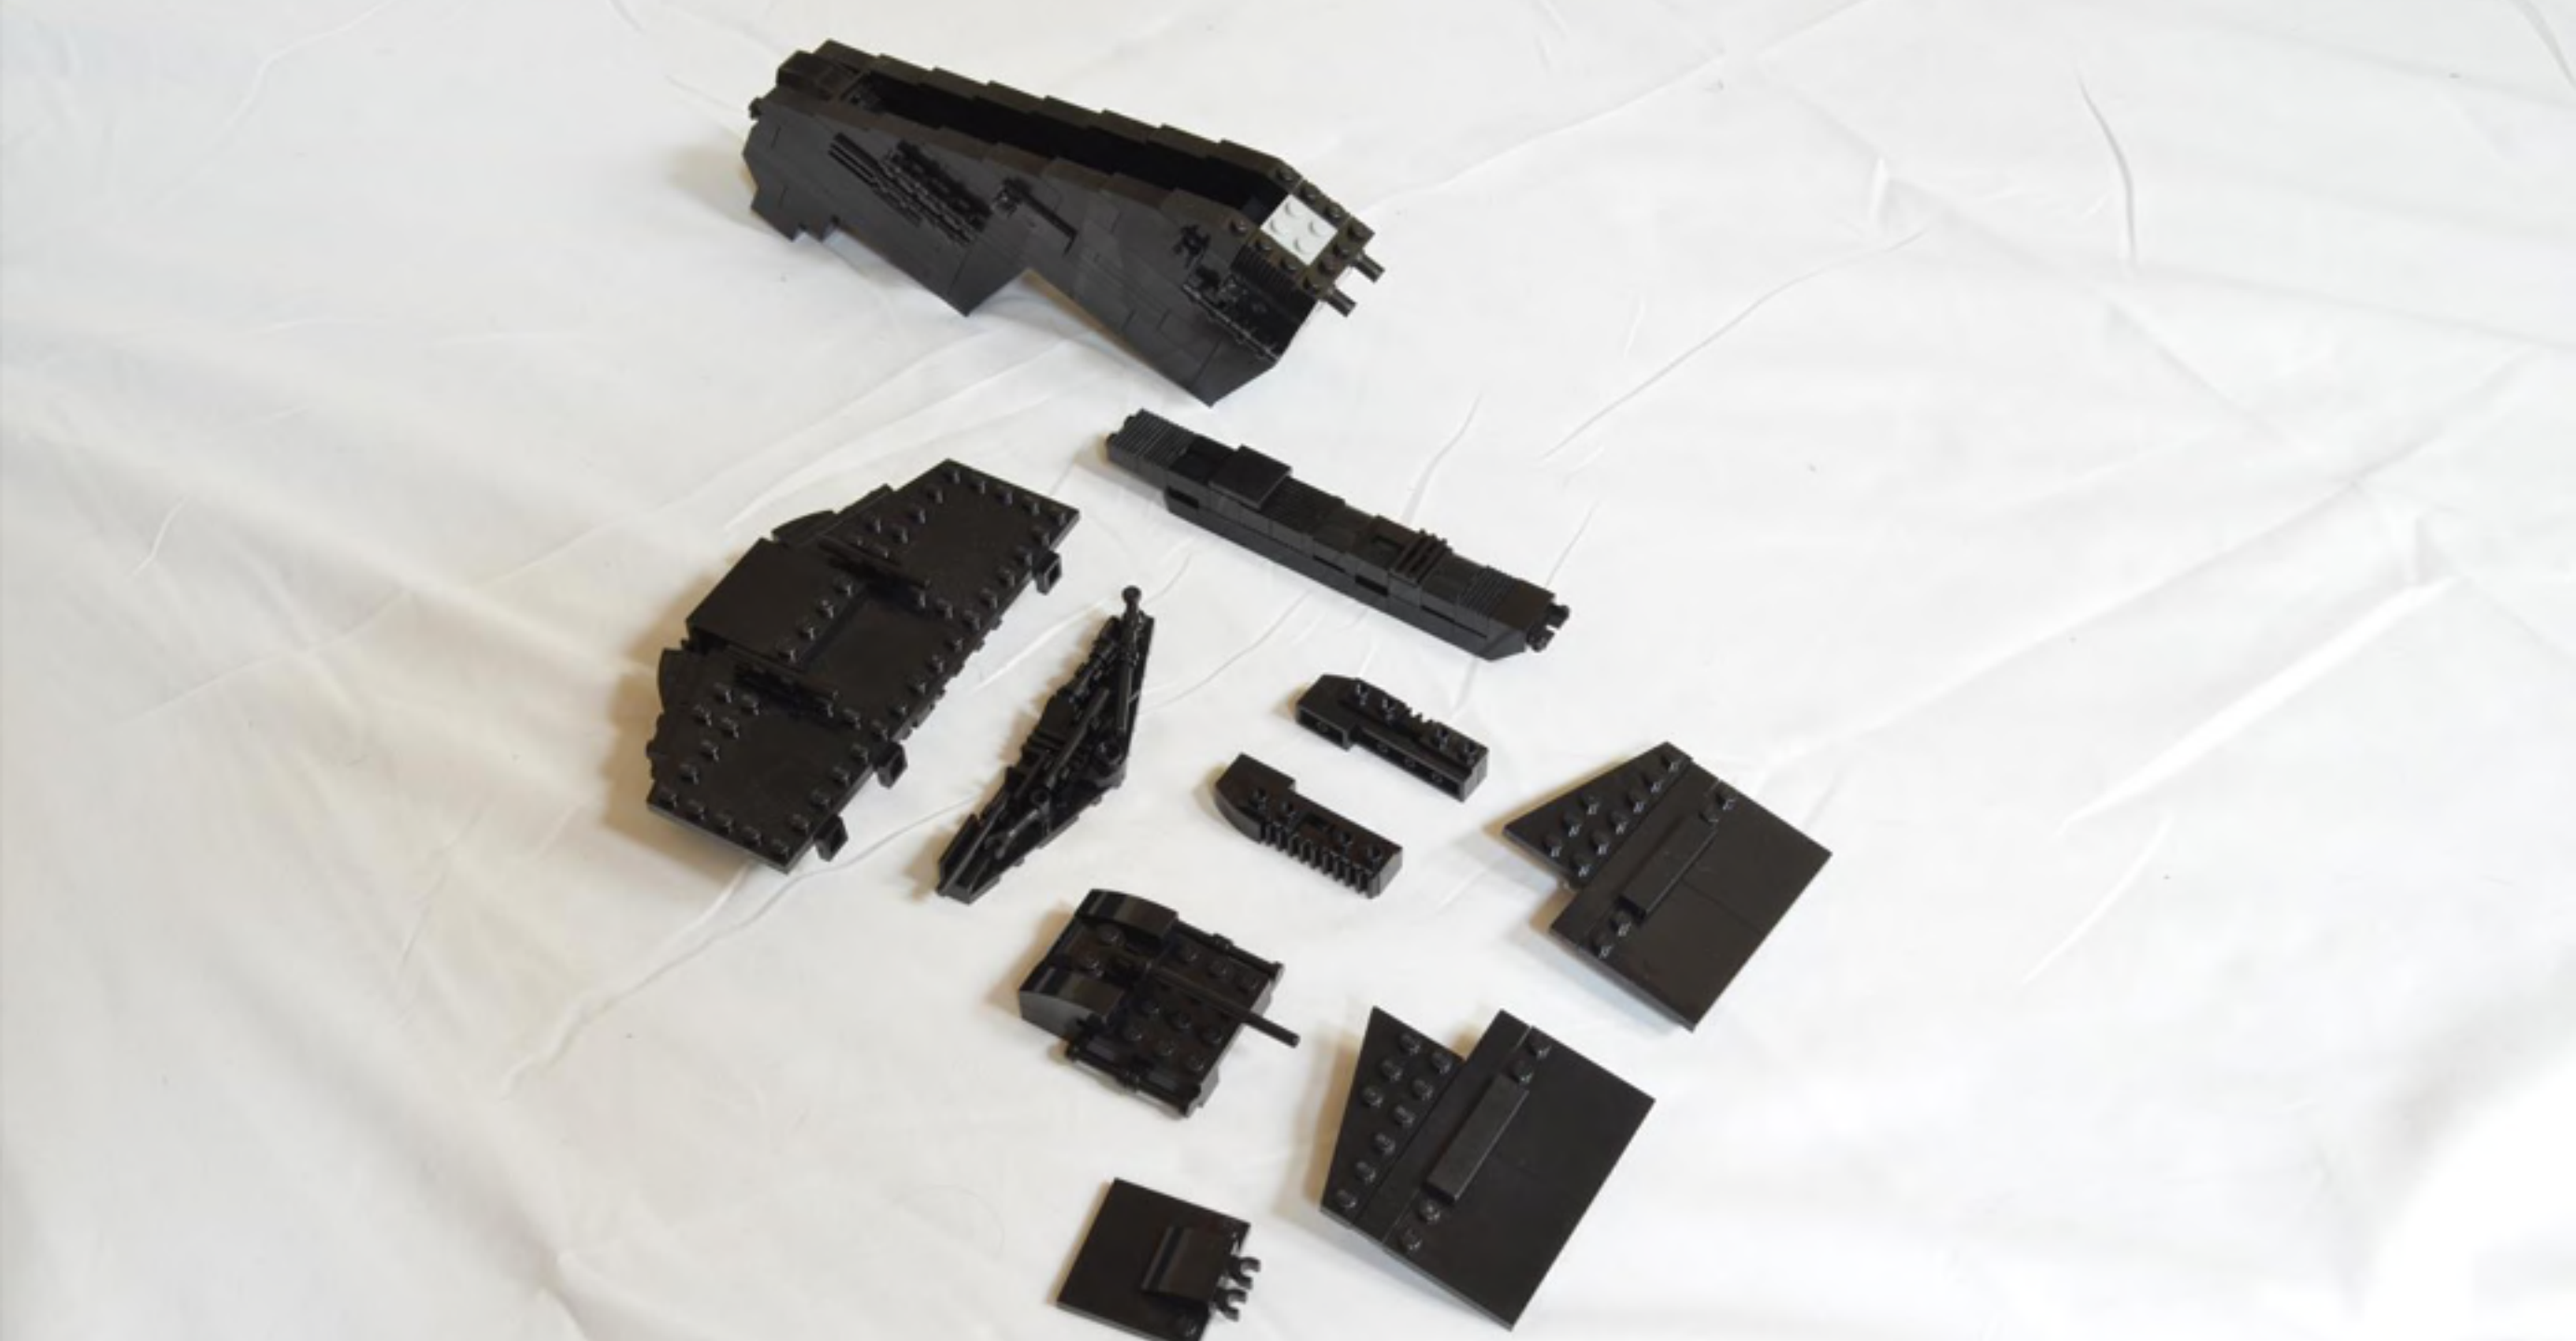


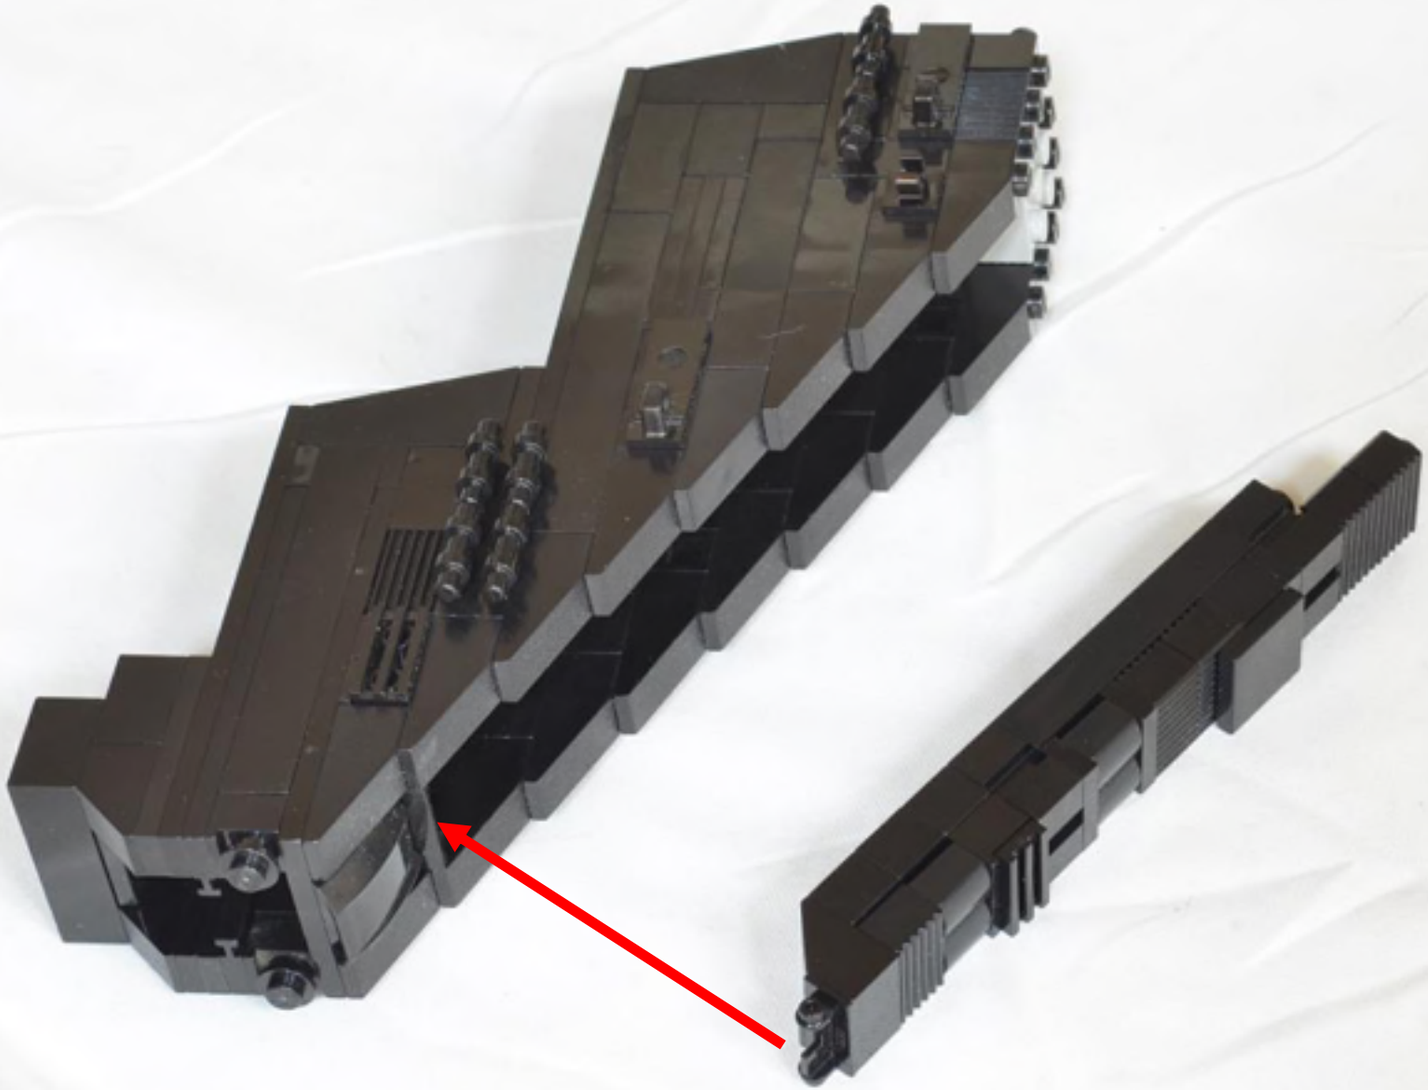
NIGHT BUS

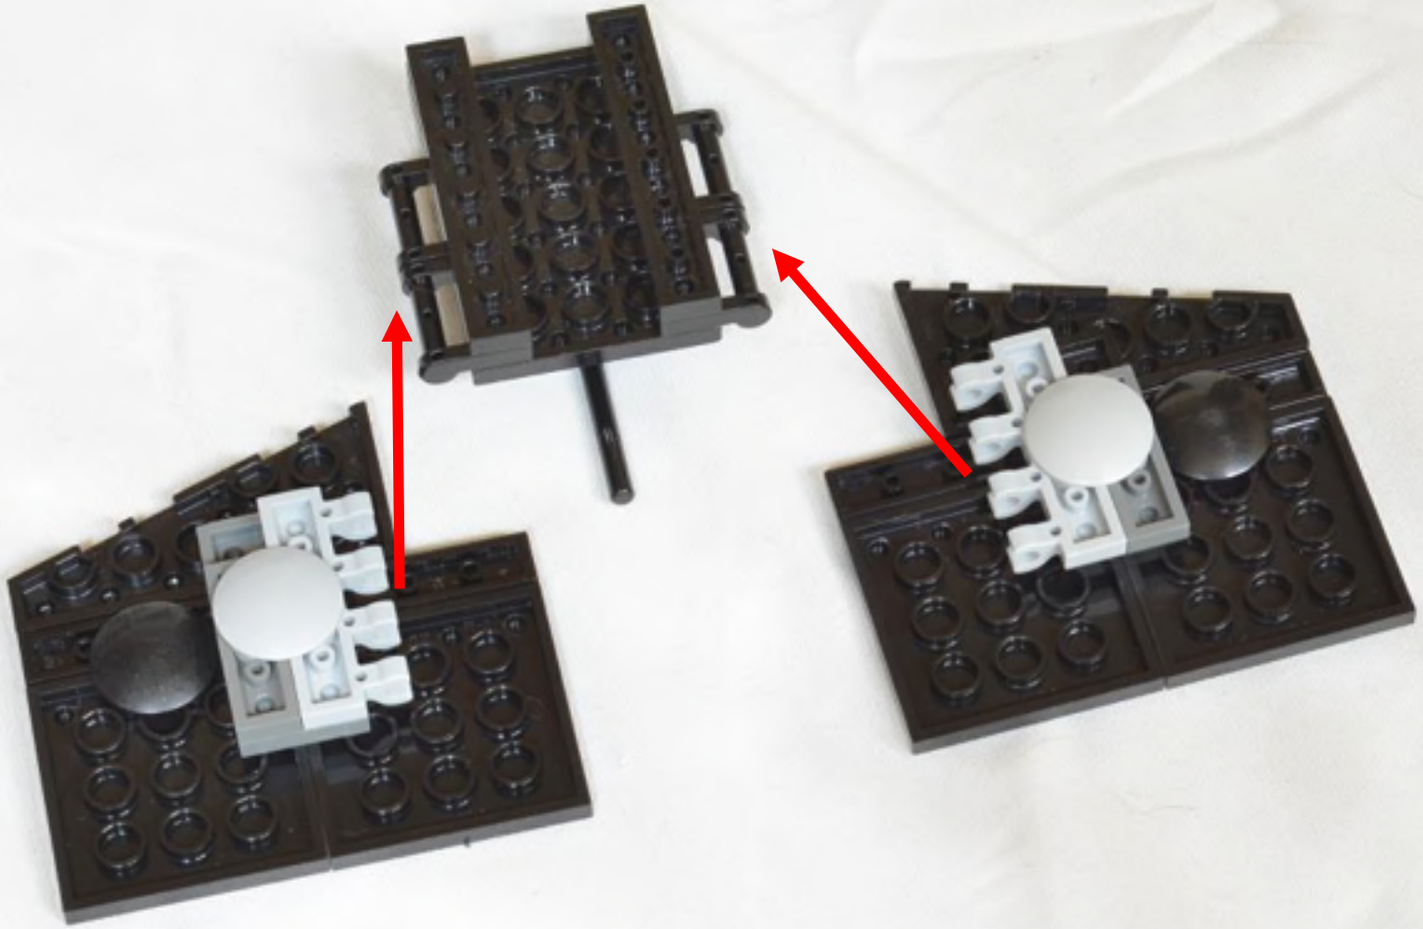


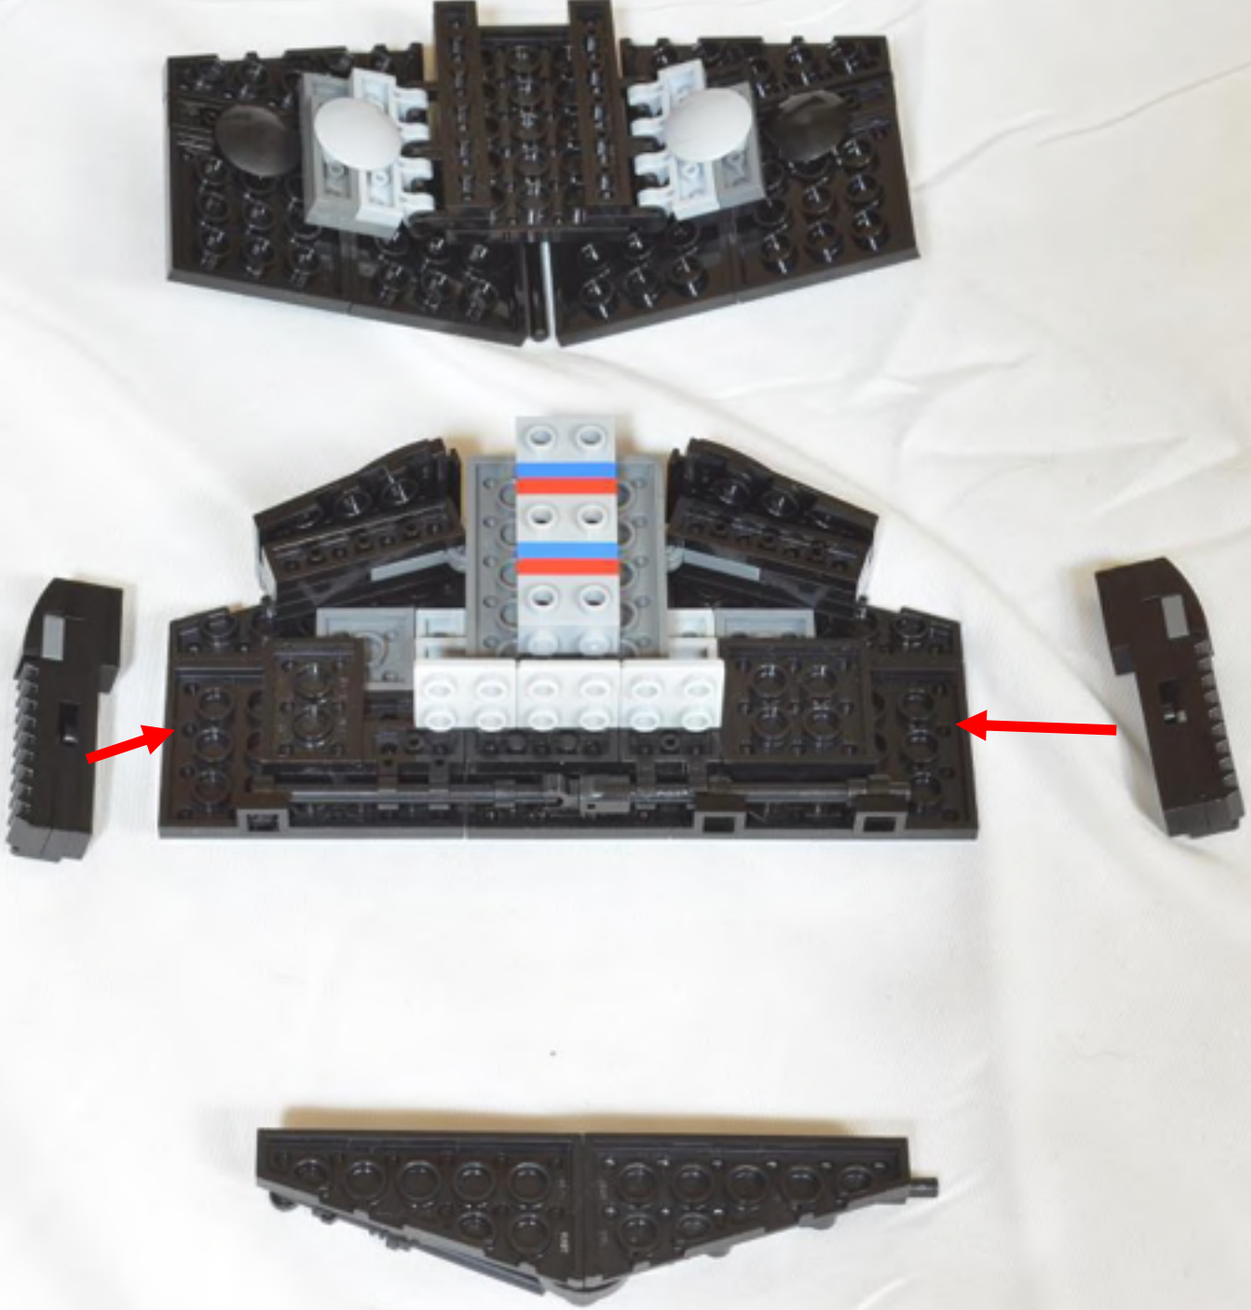
The Superstructure will be held in place by these raised panels.

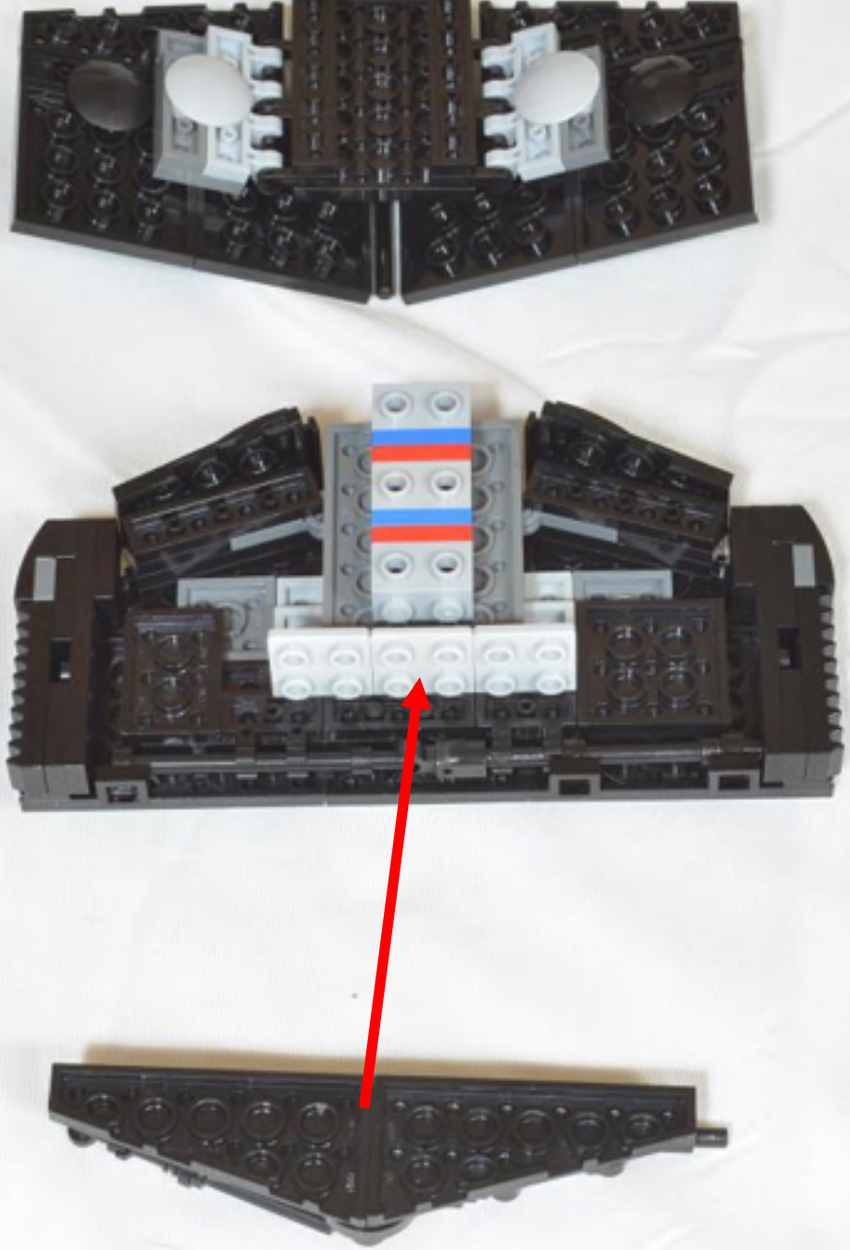


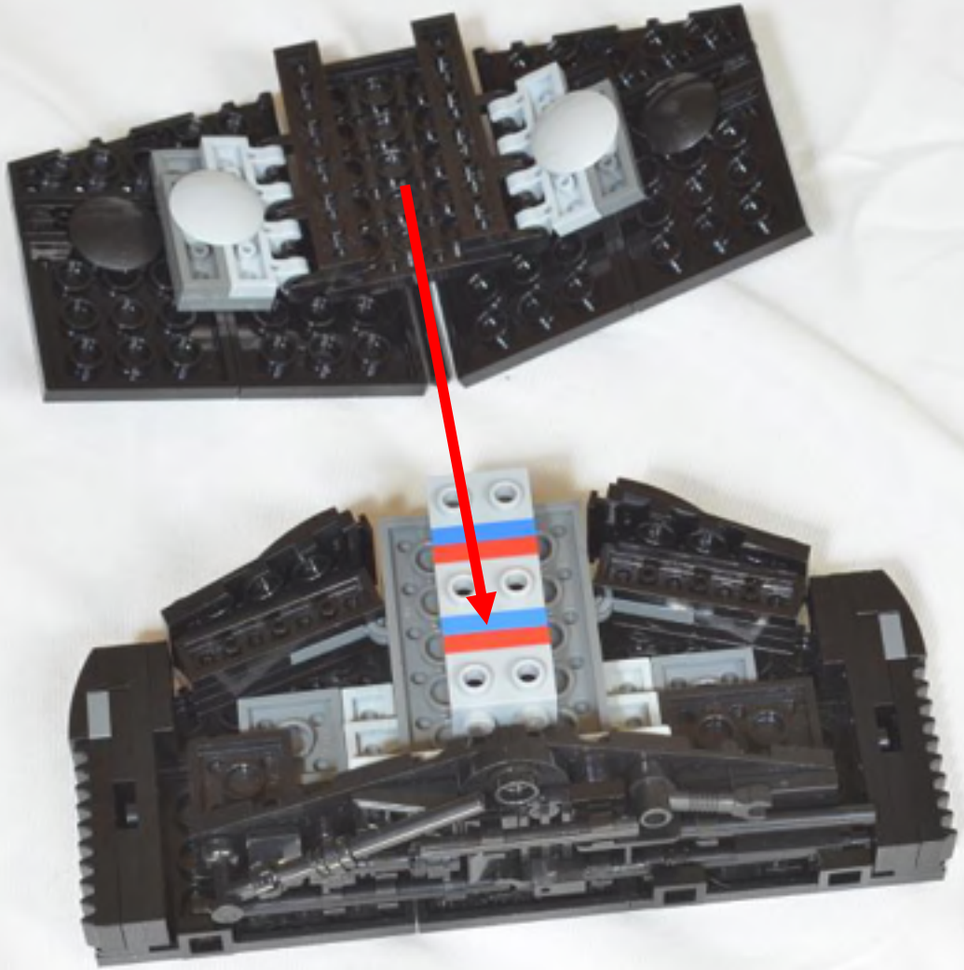


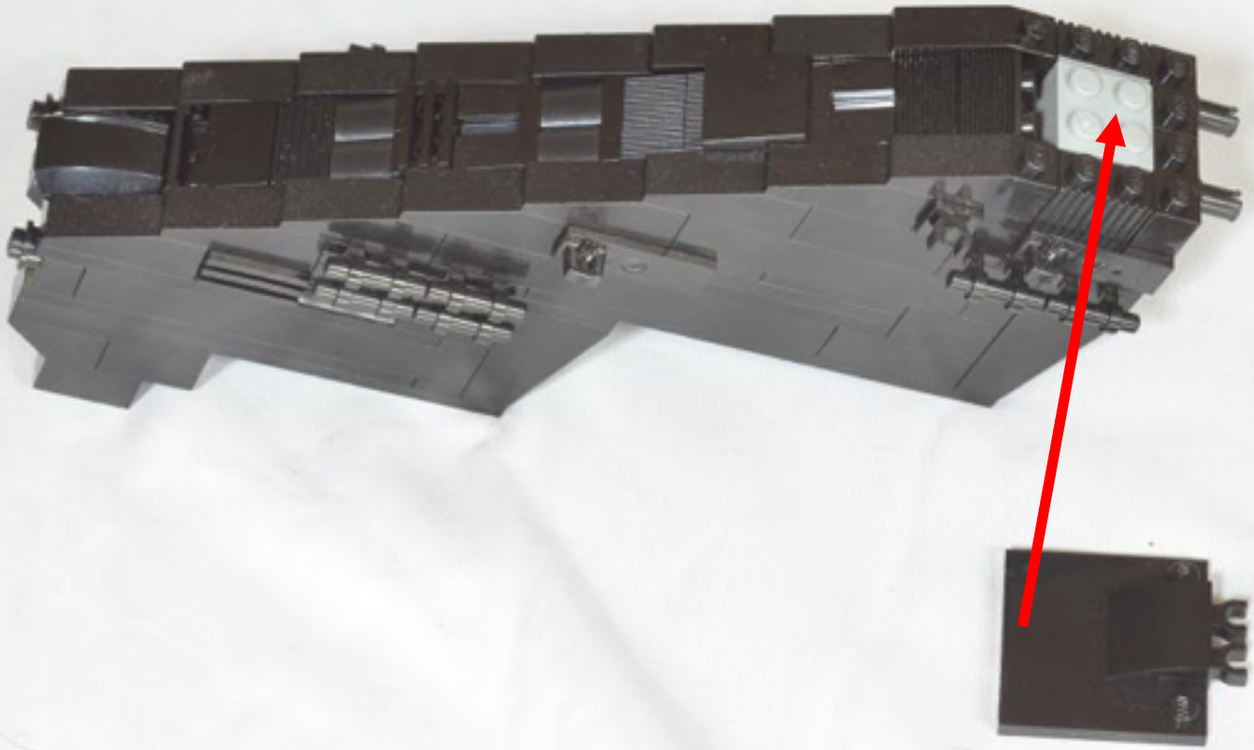


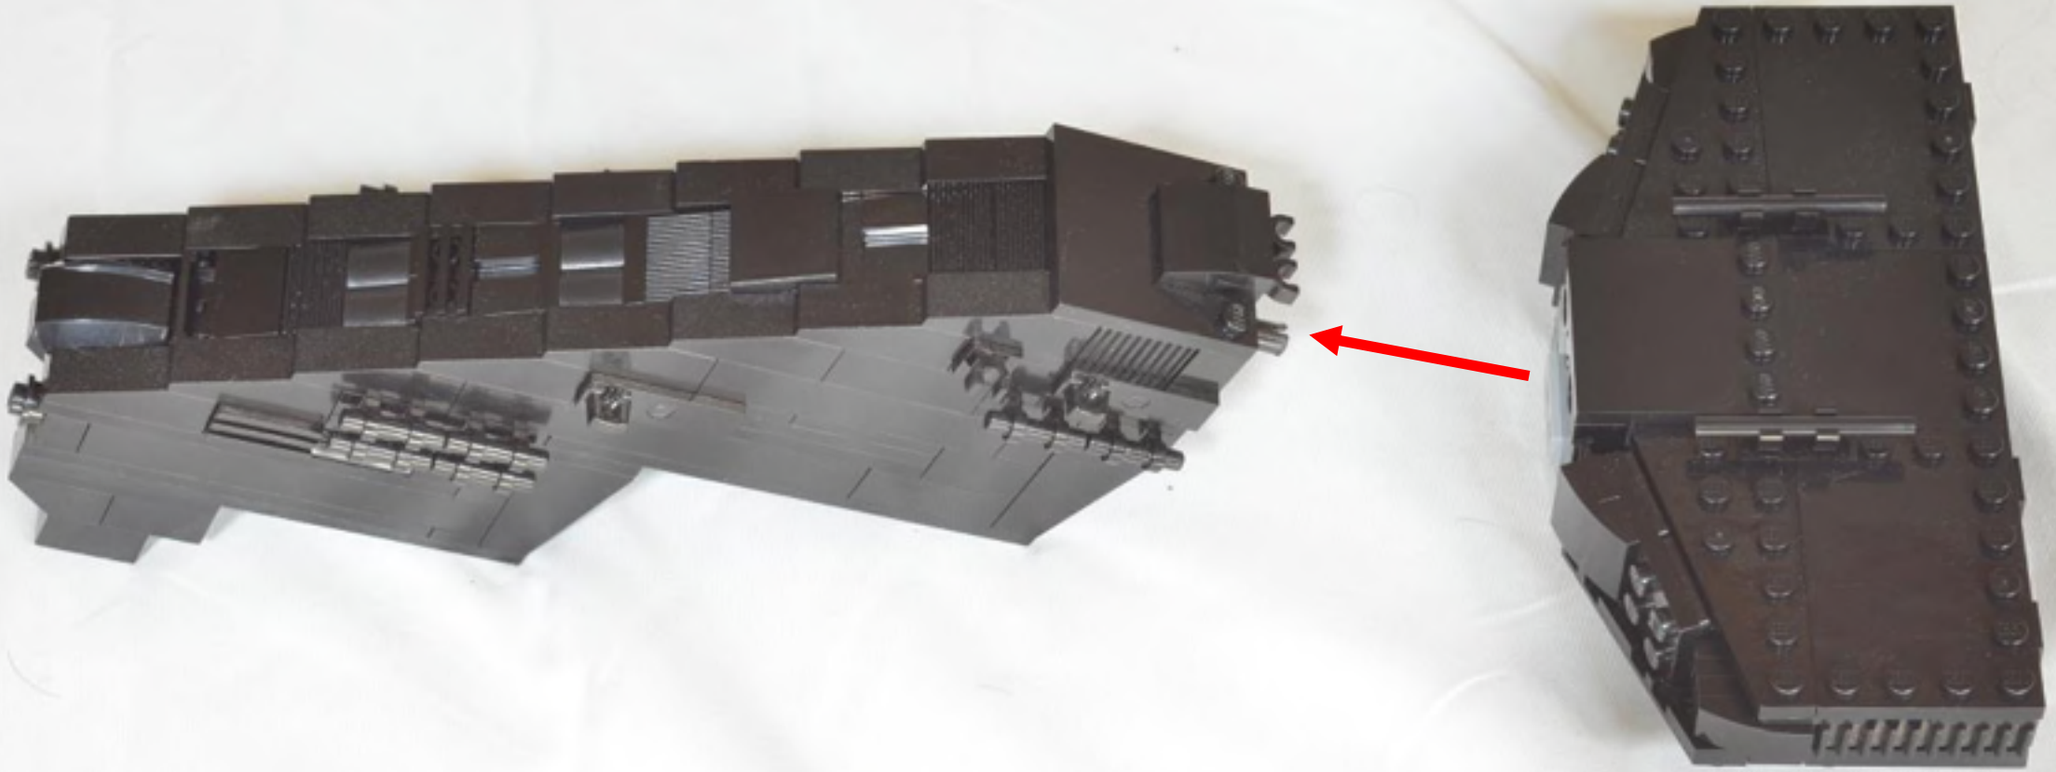


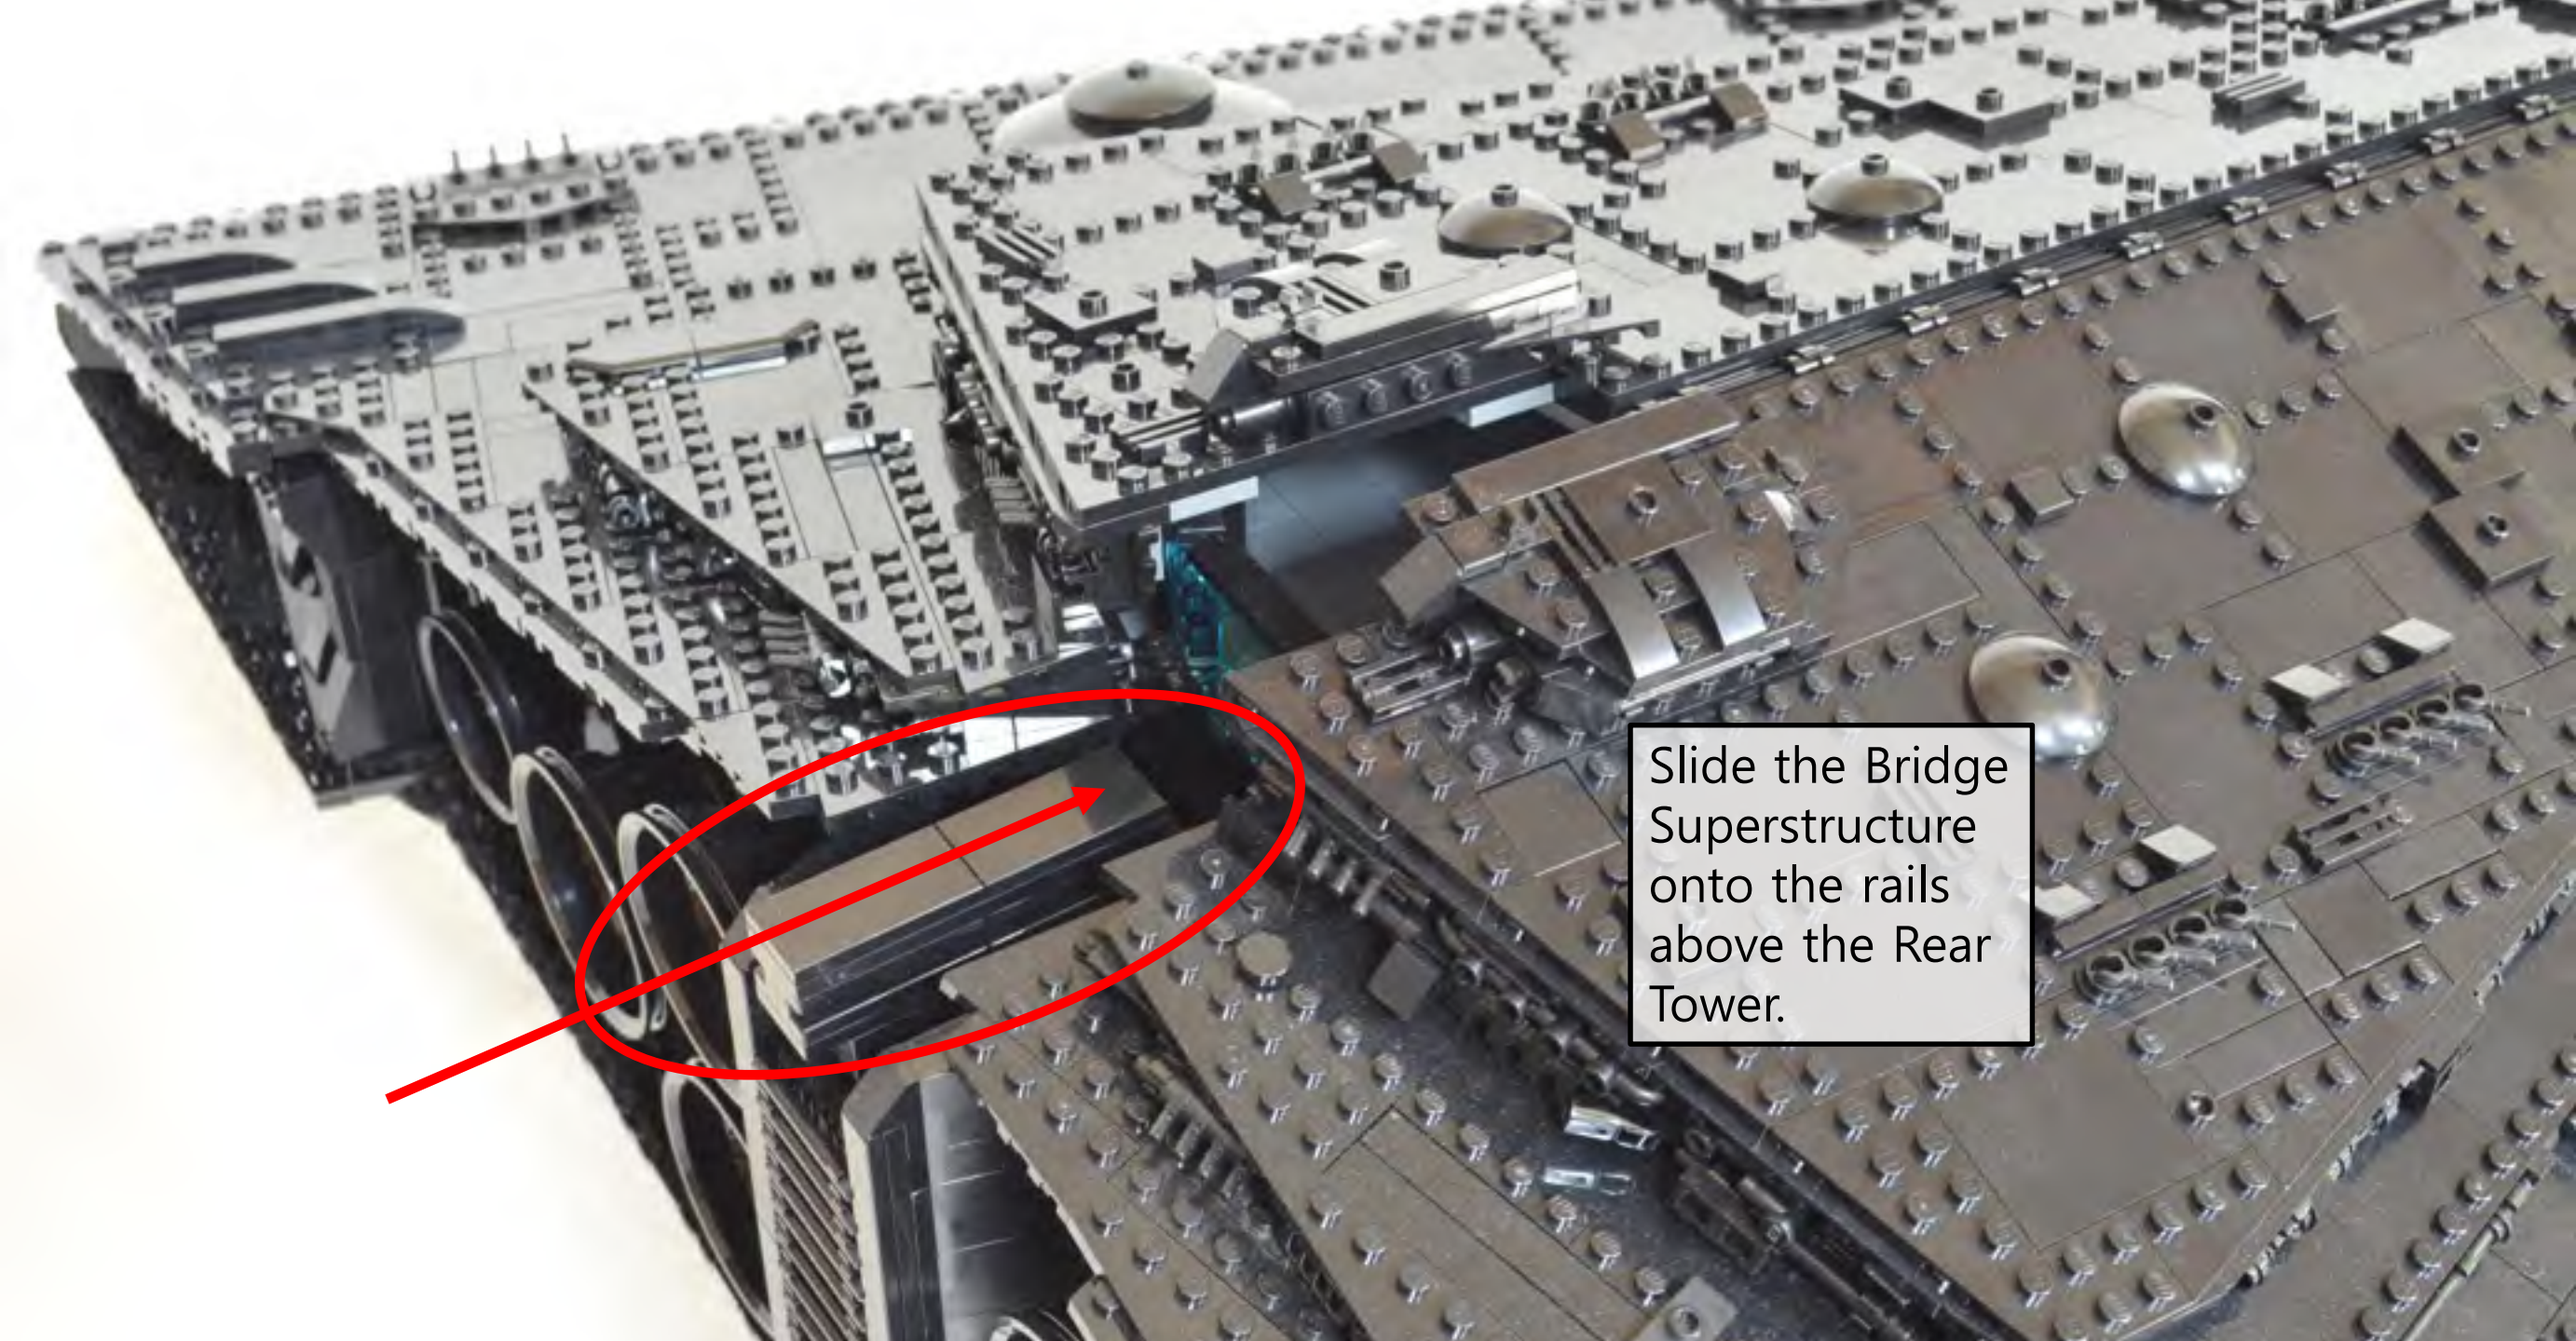




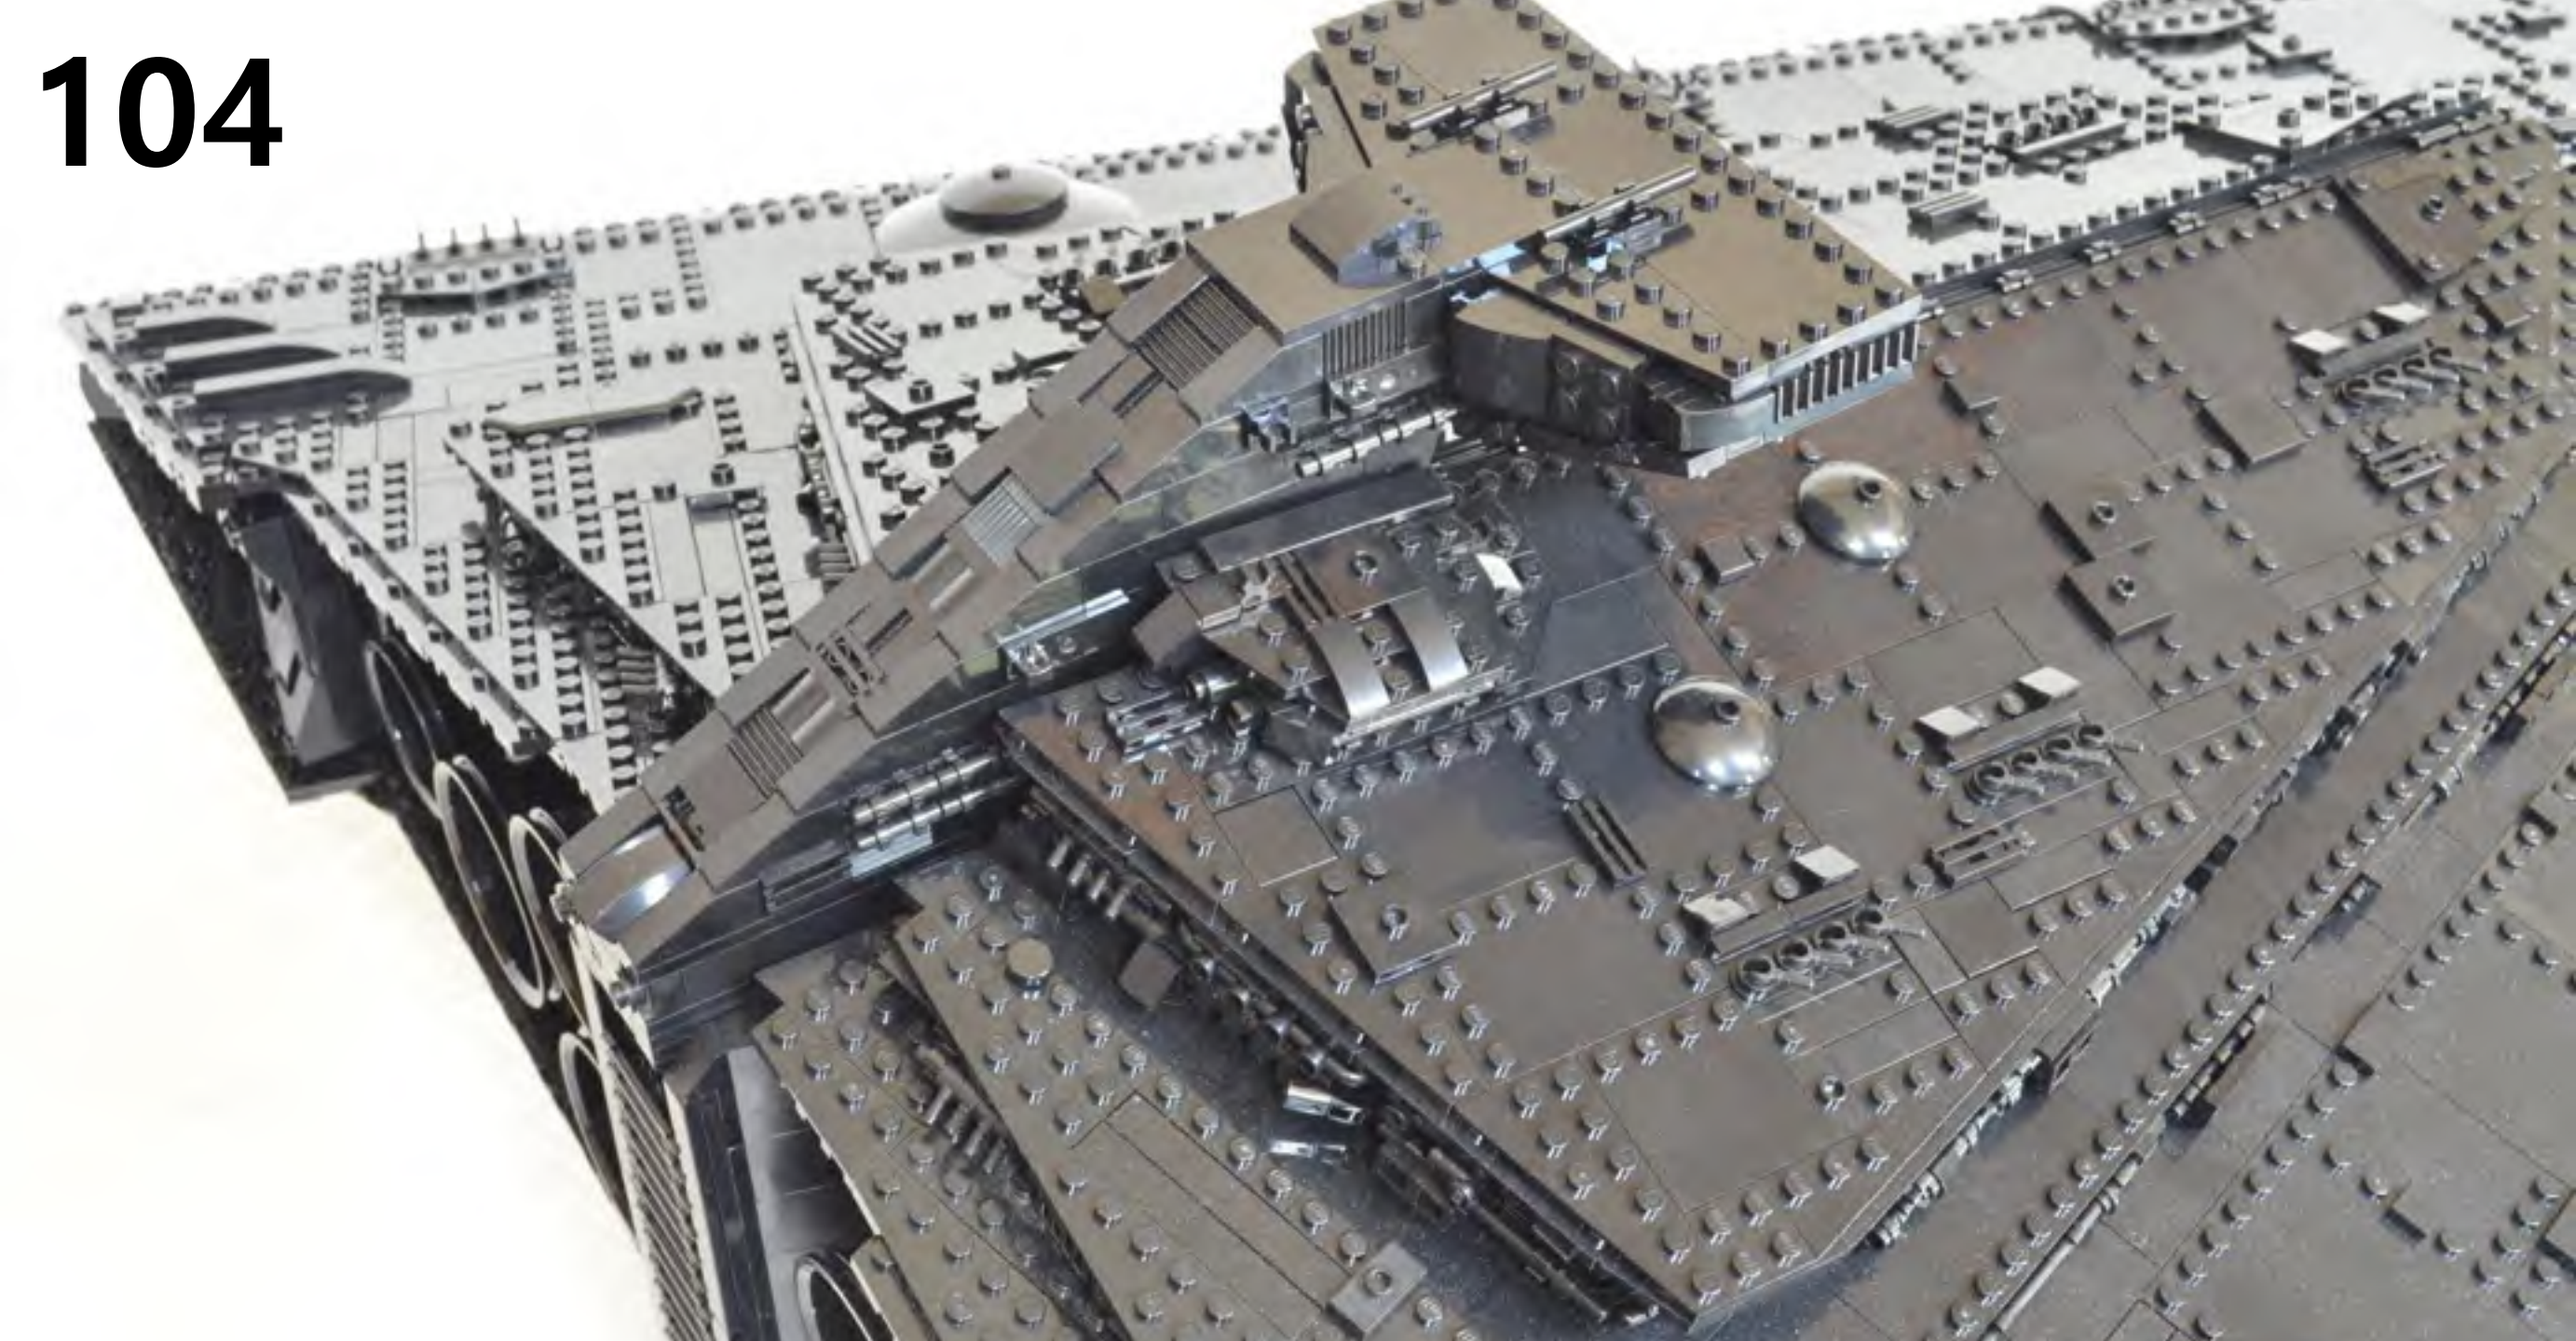


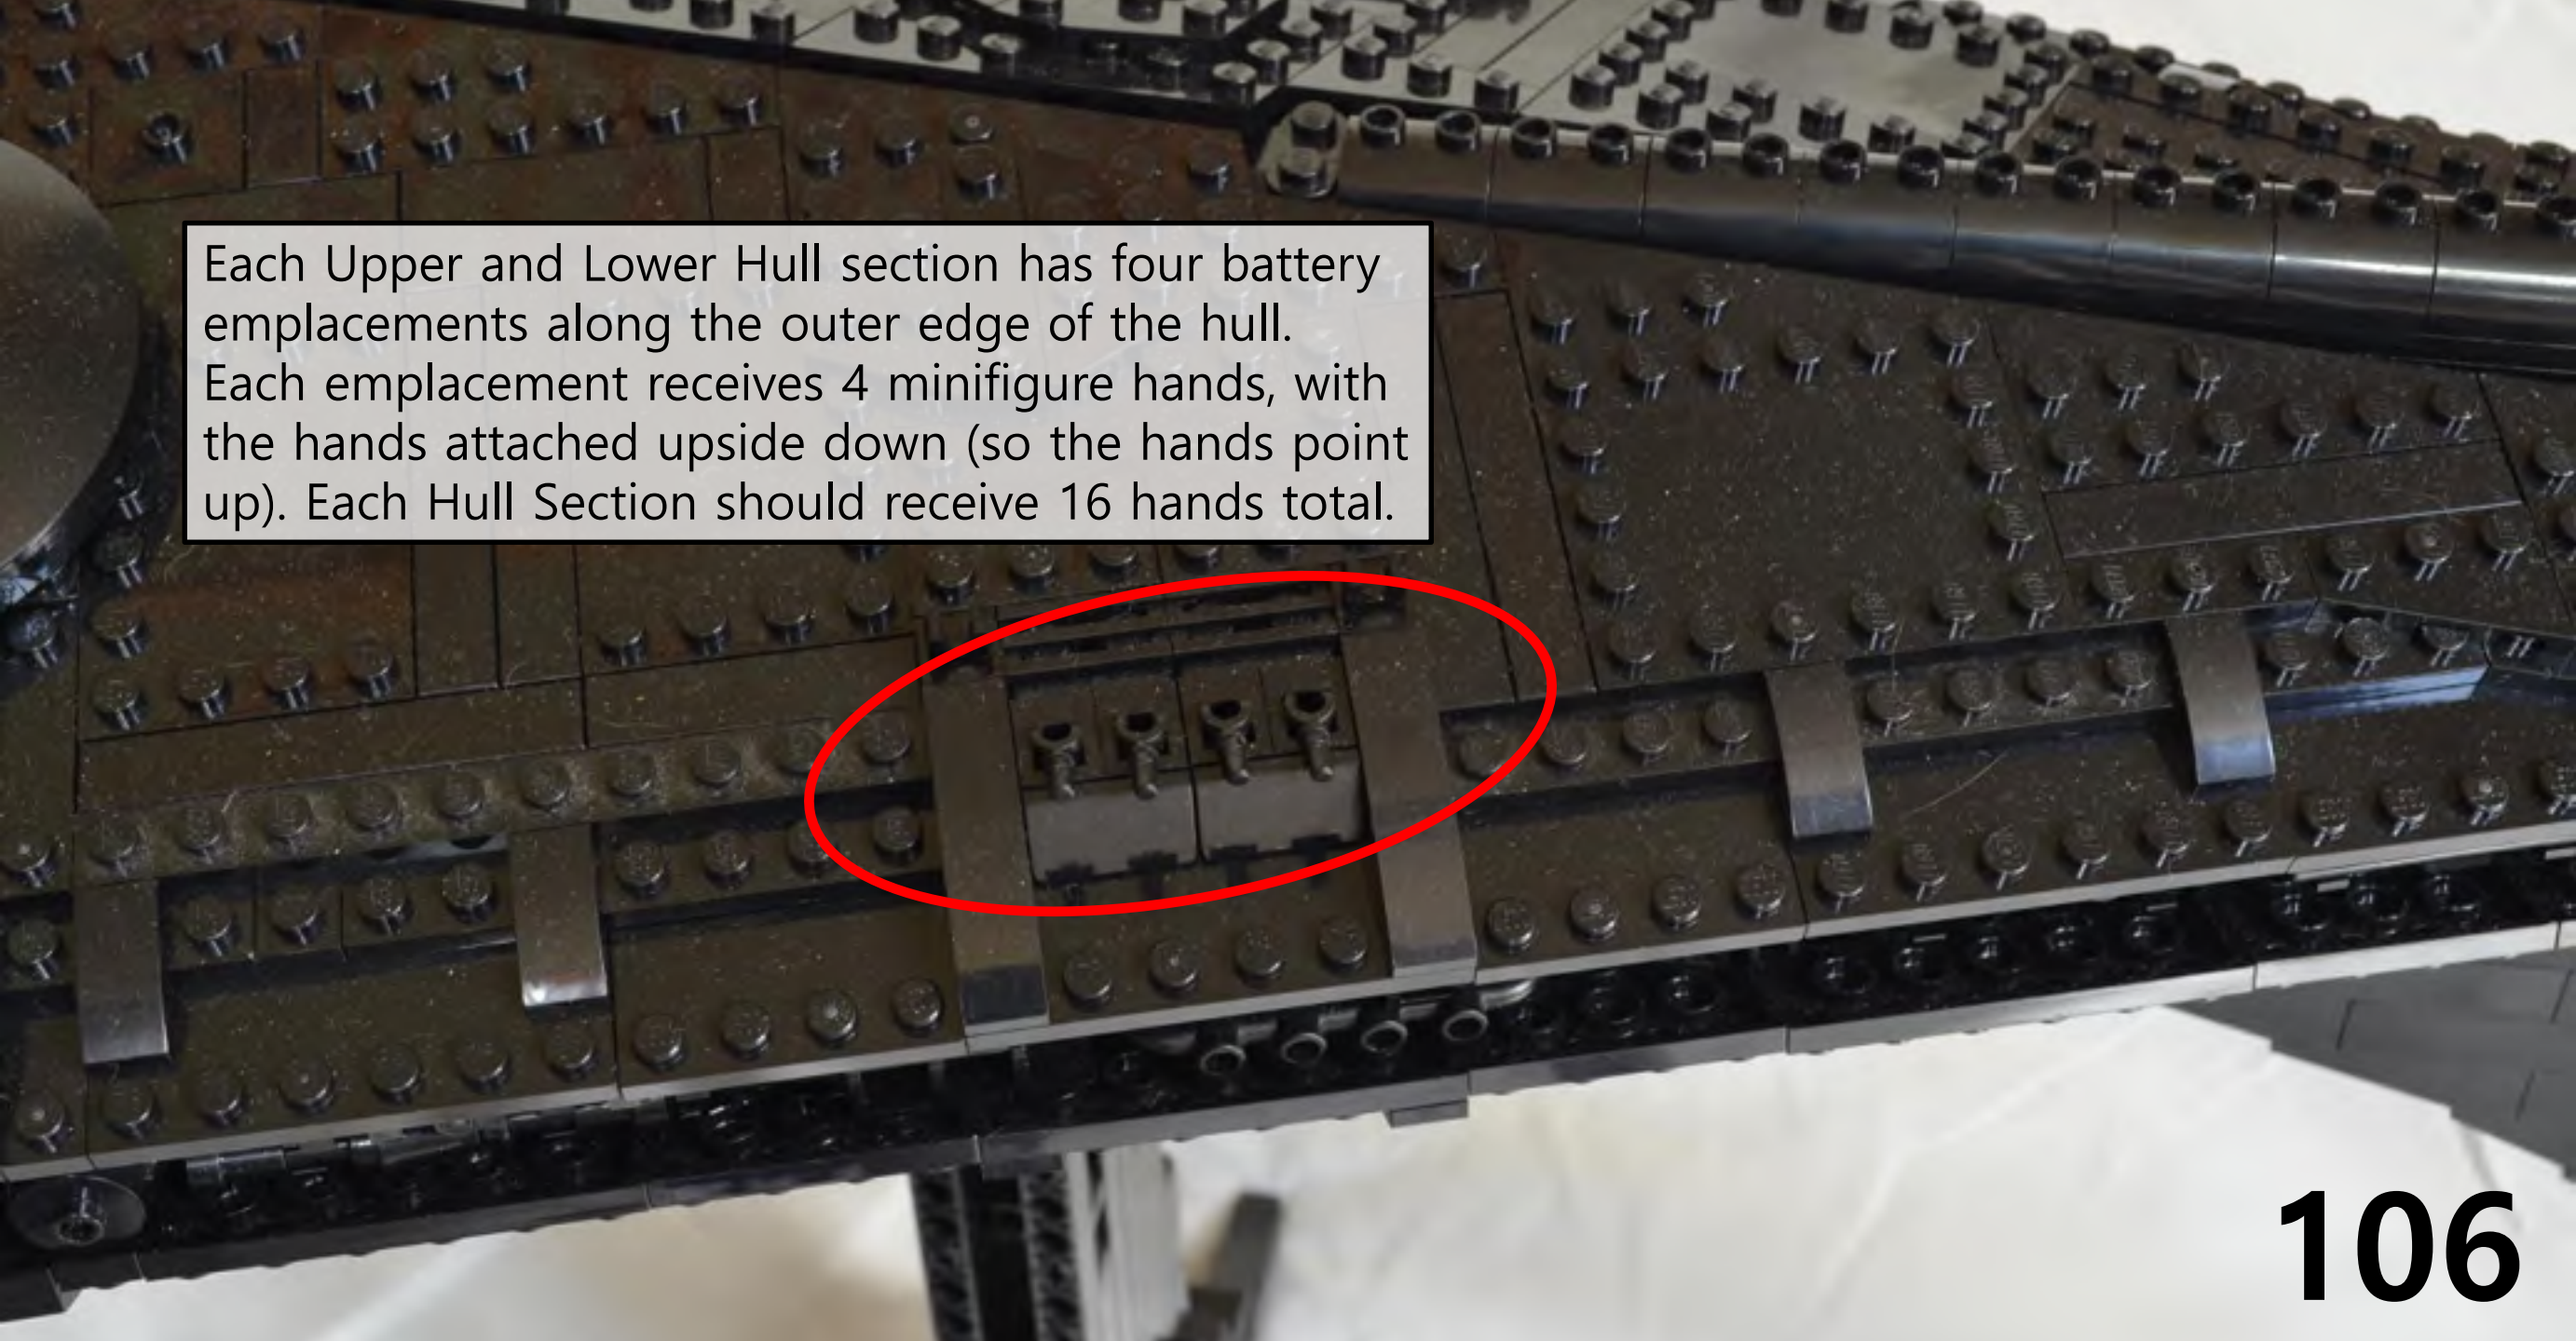




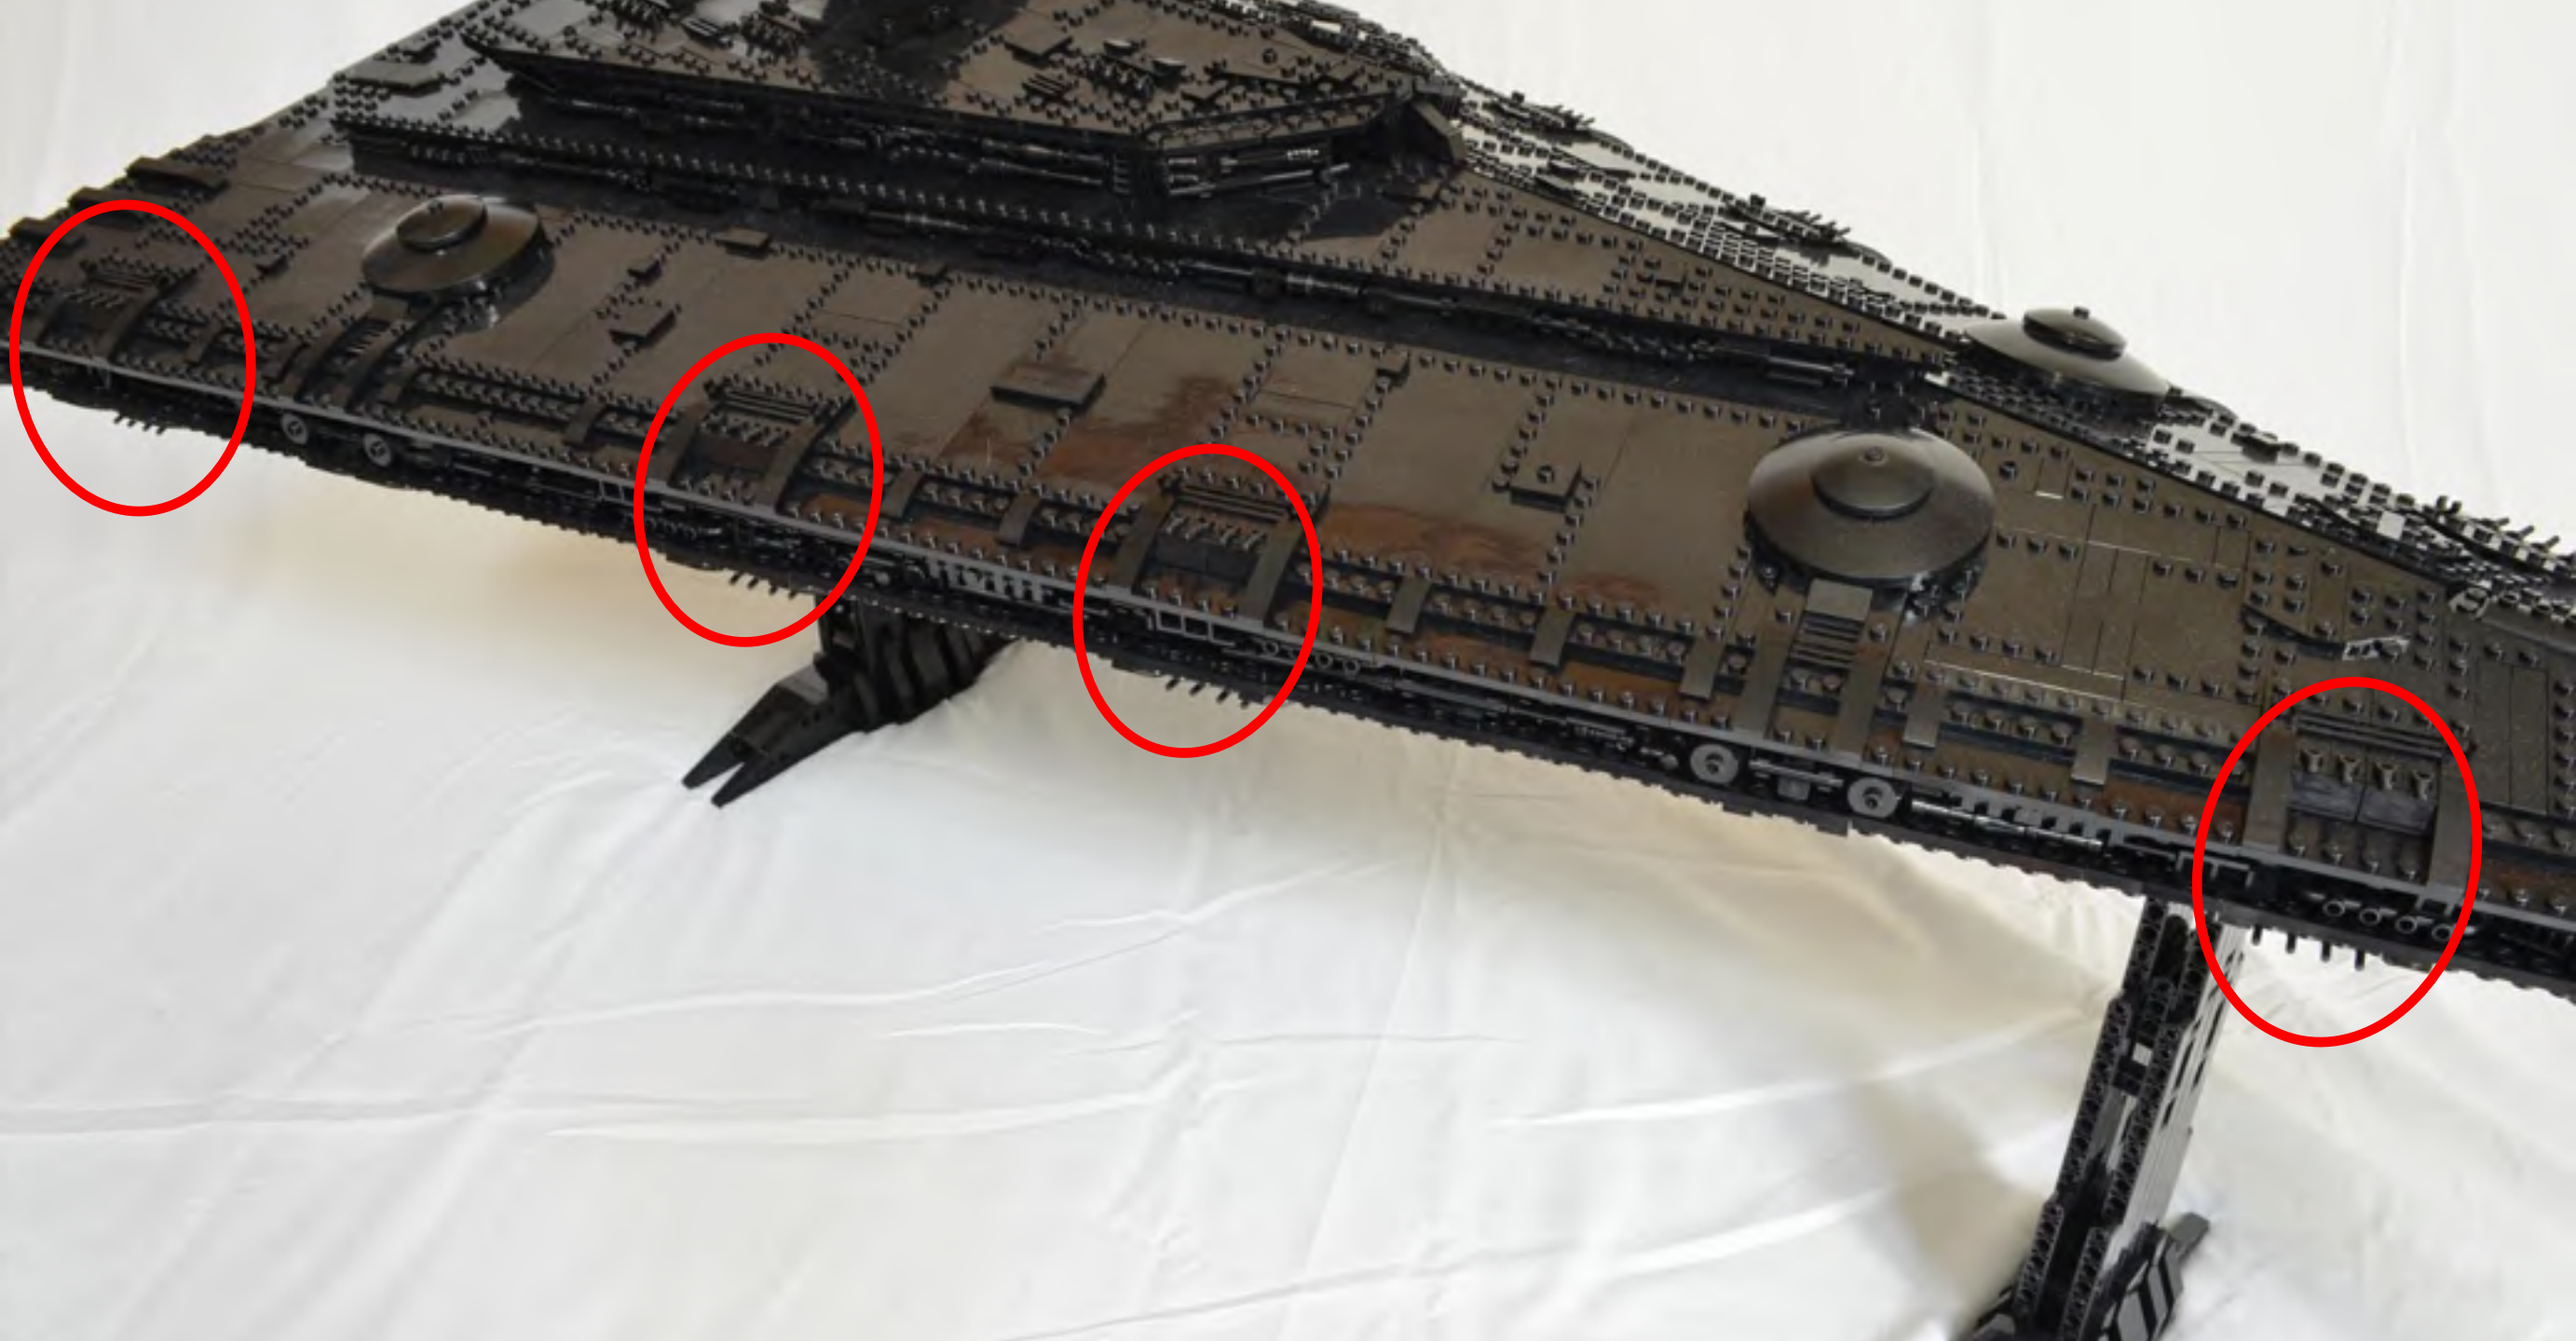


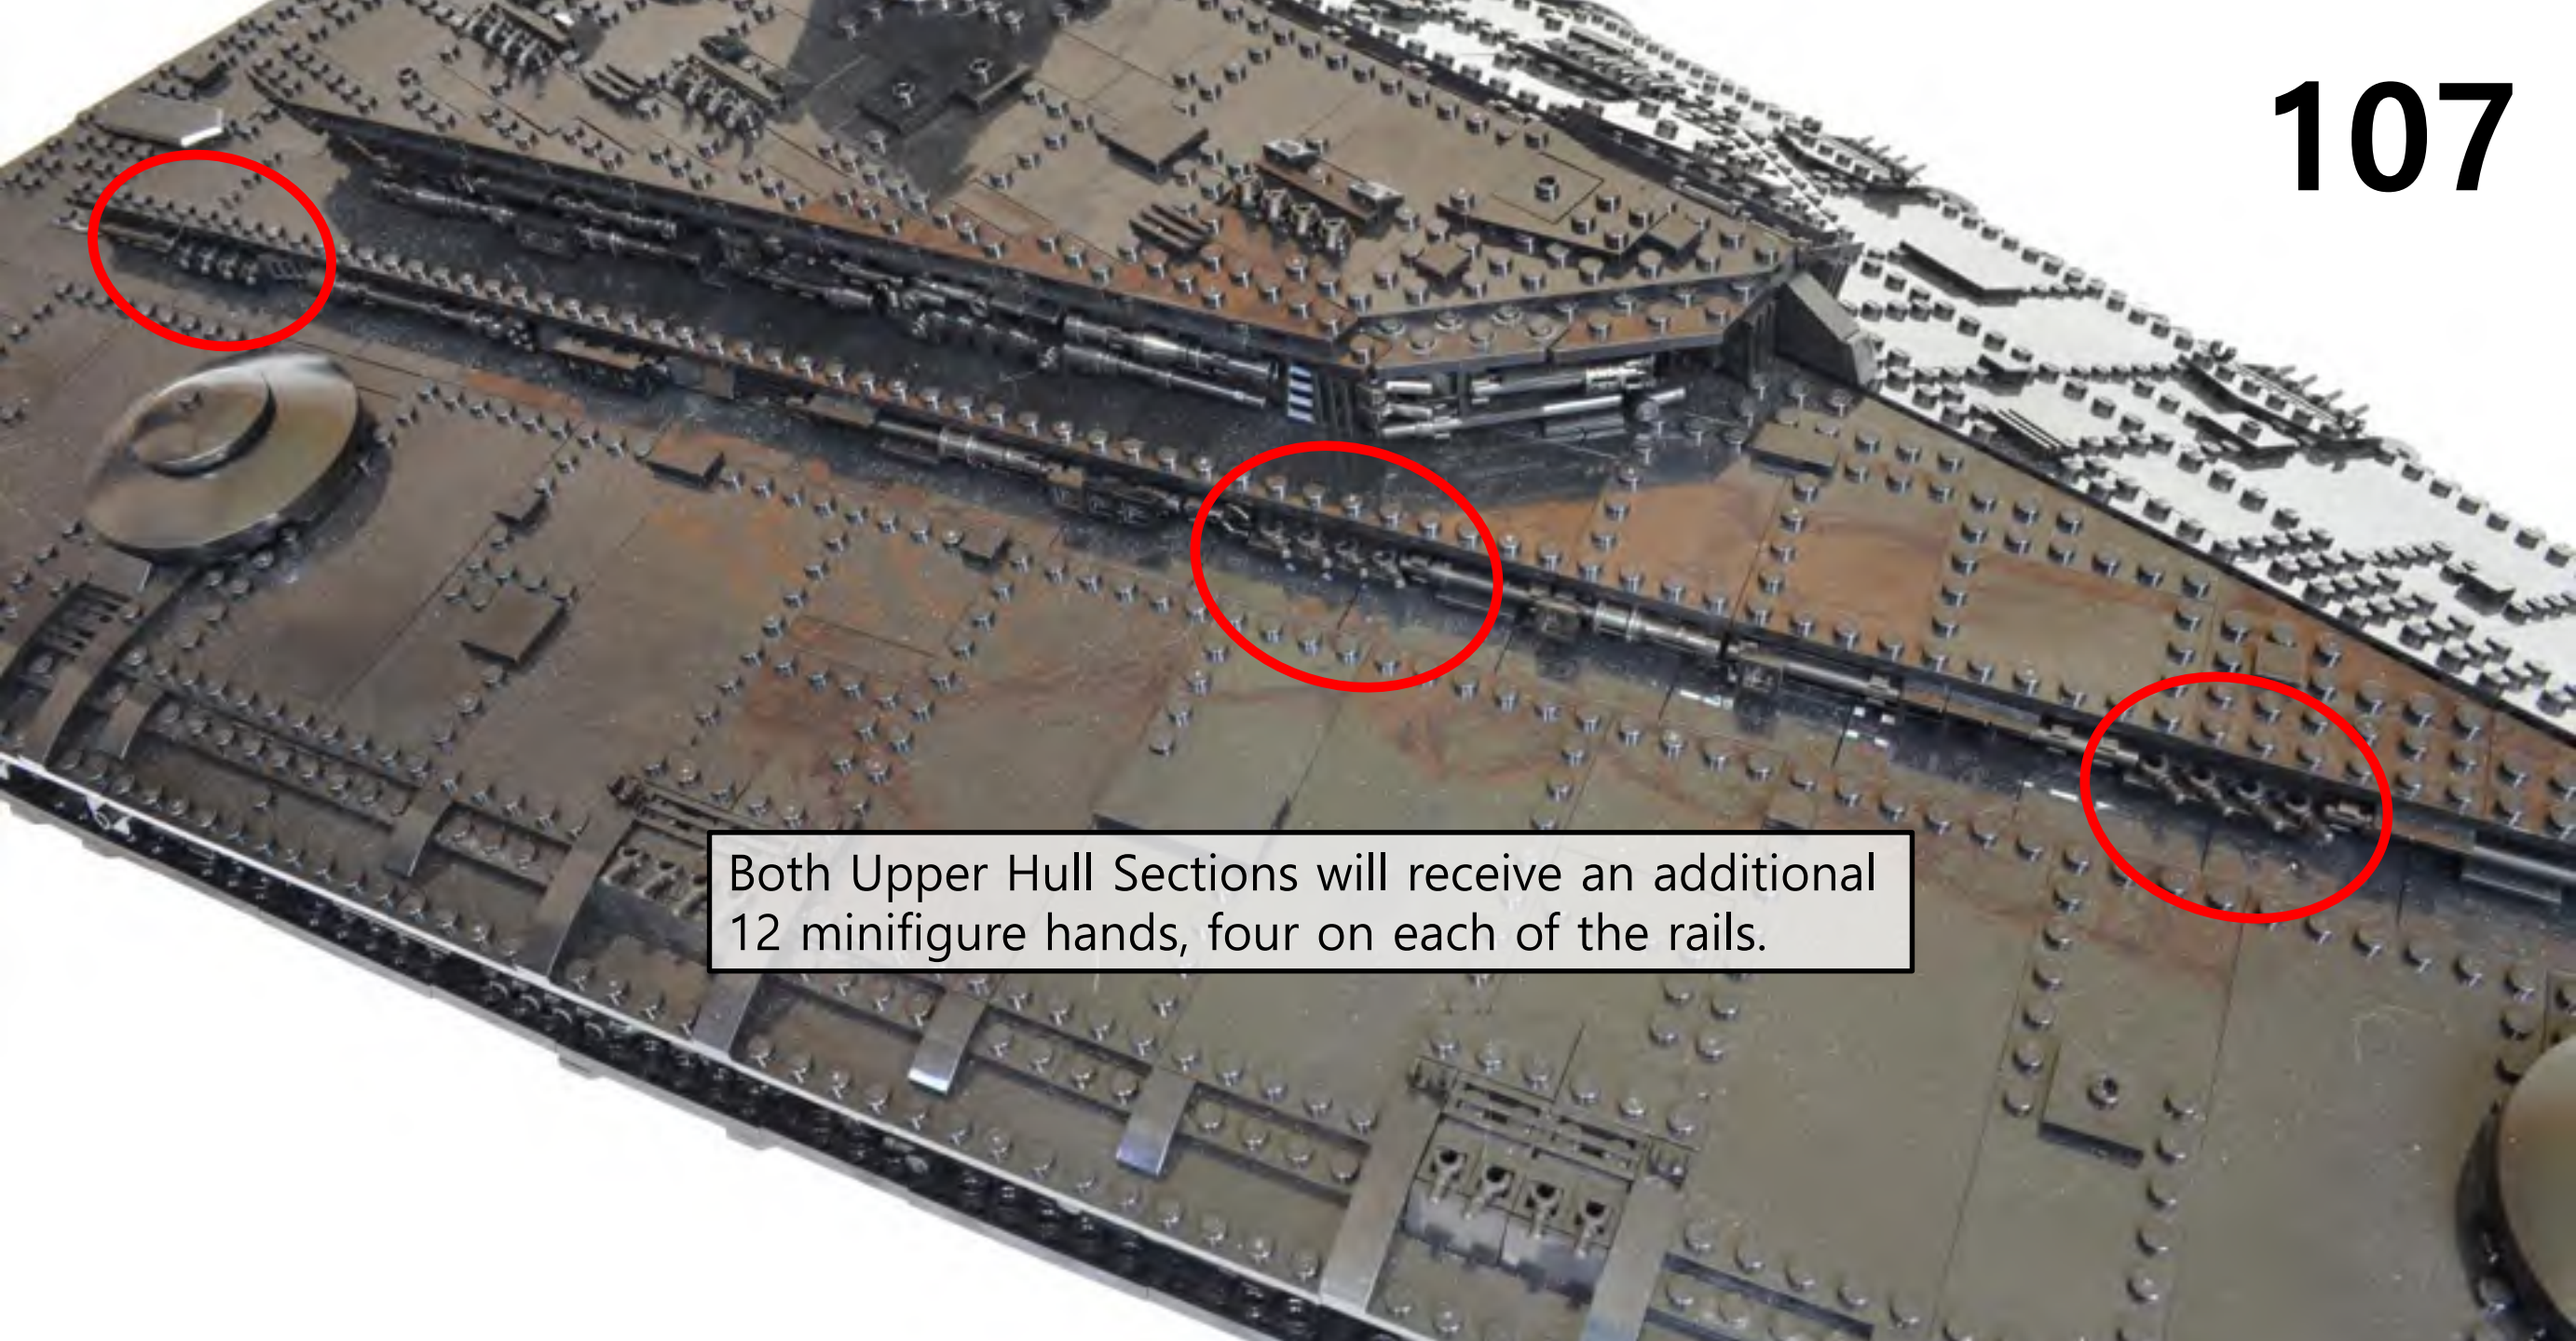
Slide the Bridge Superstructure onto the rails above the Rear Tower.



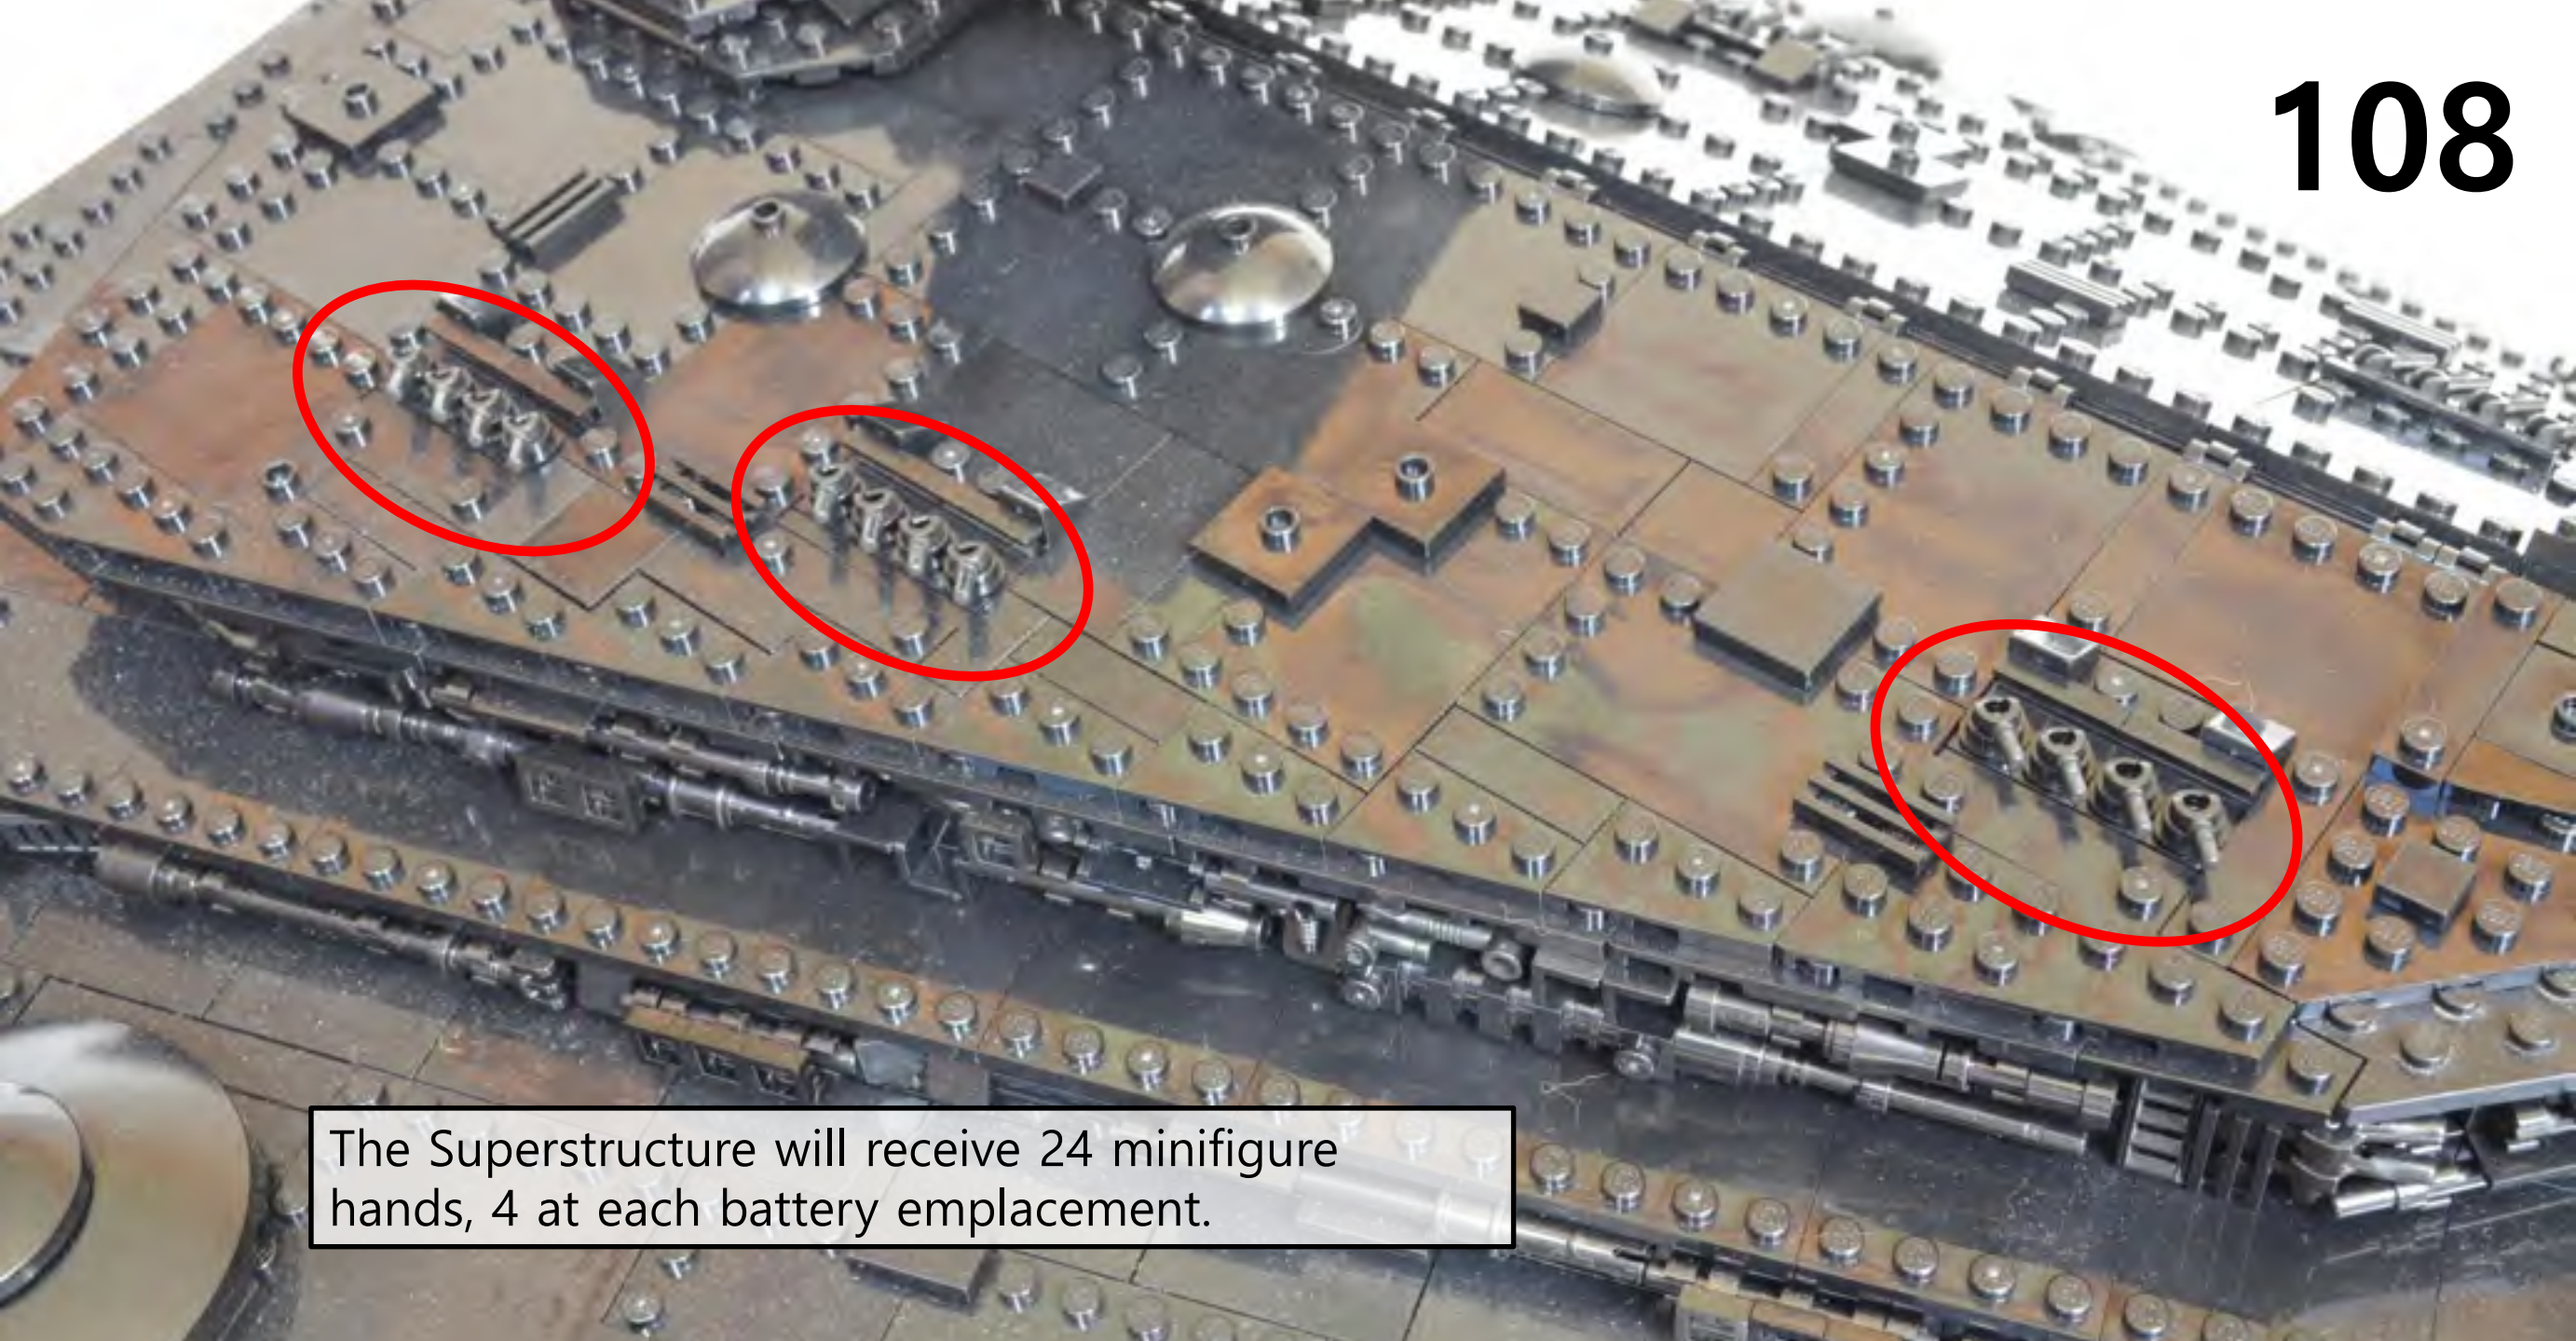


Each Upper and Lower Hull section has four battery emplacements along the outer edge of the hull. Each emplacement receives 4 minifigure hands, with the hands attached upside down (so the hands point up). Each Hull Section should receive 16 hands total.

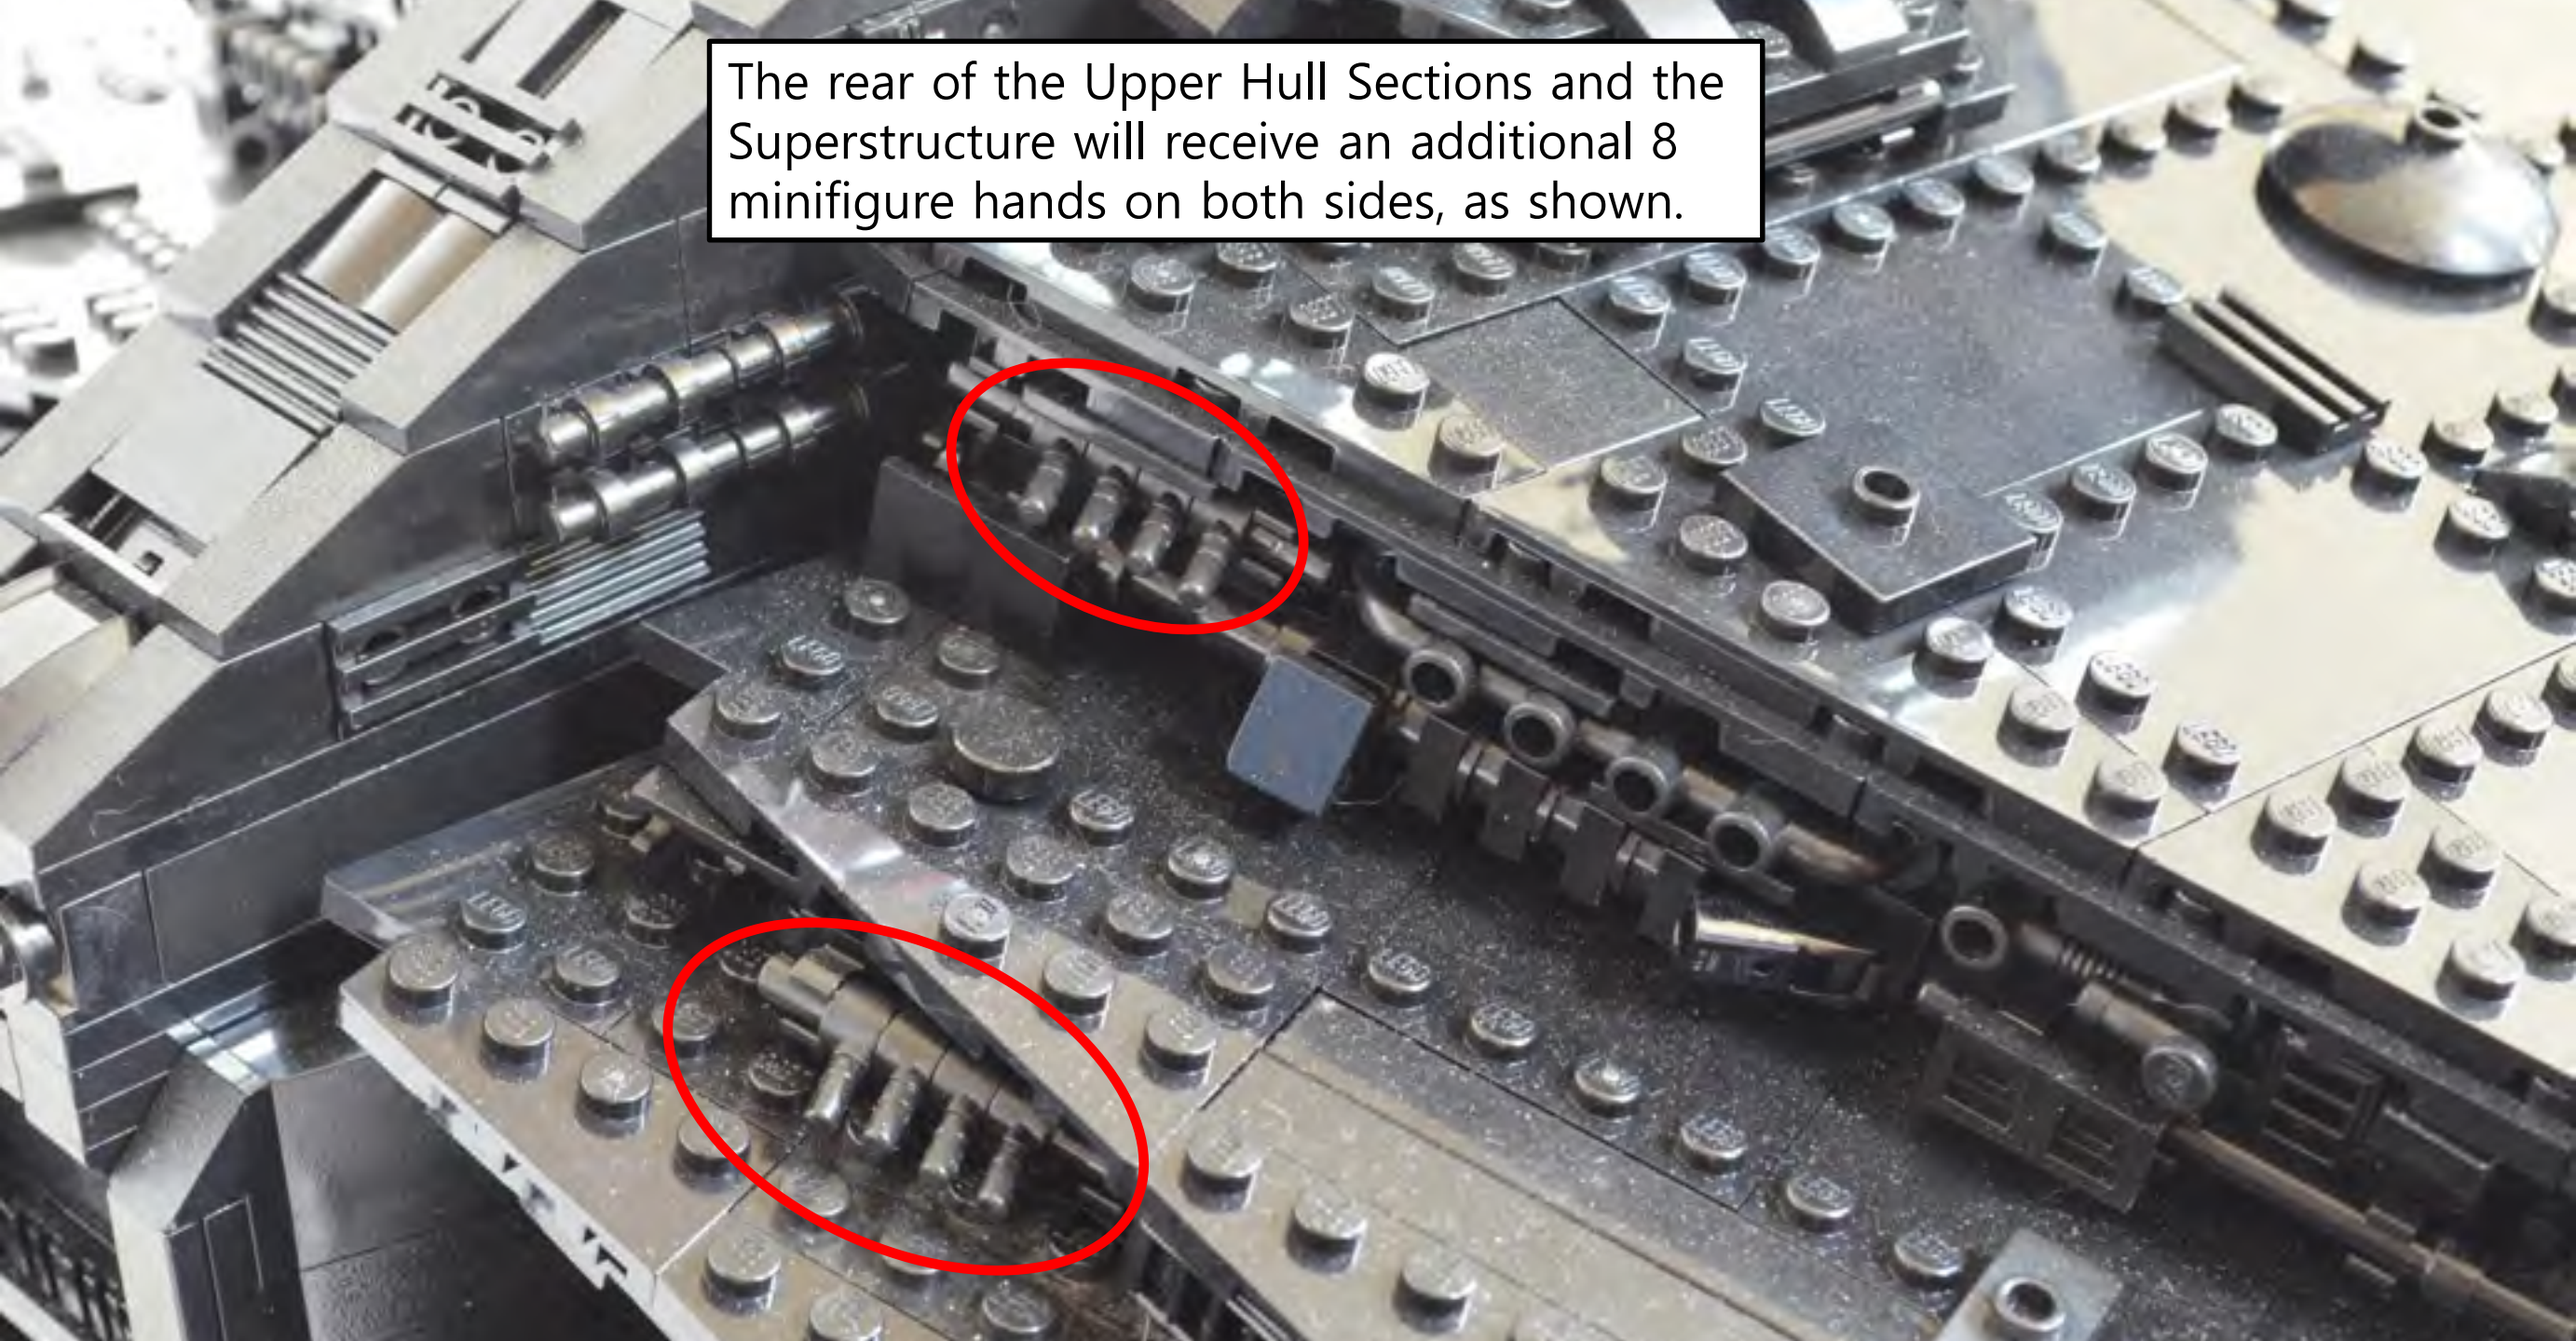




Both Upper Hull Sections will receive an additional 12 minifigure hands, four on each of the rails.



The Superstructure will receive 24 minifigure hands, 4 at each battery emplacement.



The rear of the Upper Hull Sections and the Superstructure will receive an additional 8 minifigure hands on both sides, as shown.
